# Chapter

# What's New

# What's new in the latest Wowza media server software?

Wowza Streaming Engine<sup>™</sup> is robust, customizable, and scalable media server softwork that powers reliable streaming of high-quality audio and video to any device anywhere.

Wowza Streaming Engine 4.7.6 software contains several fixes and enhancements that to improve the functionality of the media server.

# Support for recording MPEG-DASH with Wowza nDVR

The Wowza nDVR feature enables you to record a live stream with Wowza Streaming E while simultaneously allowing users to play or pause the live stream, rewind it to a pre recorded point, or resume viewing at the current live point. Wowza Streaming Engine 4 adds support to record MPEG-DASH live streams with the nDVR feature.

# Facebook Live Stream Target enhancements

The Stream Targets feature in Wowza Streaming Engine enables you to send live strea content delivery networks (CDNs), streaming servers, streaming services, and multicas networks for distributed delivery. The destinations distribute your live stream, enabling to scale your Streaming Engine implementation, computing resources, and delivery op for a variety of scenarios. One such destination is Facebook Live. Wowza Streaming En 4.7.6 adds support for recent changes to the Facebook REST API. For more information How to stream to Facebook Live using Wowza Streaming Engine.

# Chapter

# Introduction

# What is Wowza Streaming Engine?

Wowza Streaming Engine<sup>™</sup> is high-performance, extensible, and fully interactive m streaming software platform that provides live and on-demand streaming, chat, a remote recording capabilities to a wide variety of media player technologies. The Wowza Streaming Engine software can deliver content to many popular media players as Adobe Flash Player; Microsoft Silverlight player; Apple iPhone, iPad, and iPod touch a Apple QuickTime player (version 10 or later); Android smartphones and tablets; and IPTV/OTT set-top boxes. Wowza Streaming Engine software includes support for many streaming protocols including Adobe HTTP Dynamic Streaming (Adobe HDS), Apple HT Streaming (Apple HLS), Microsoft Smooth Streaming, MPEG-DASH streaming, MPEG-2 Transport Streams (MPEG-TS), Real Time Messaging Protocol (RTMP), Real Time Stream Protocol (RTSP), and Real-time Transport Protocol (RTP). It's an alternative to the Adobe Media Server, Darwin Streaming Server, Microsoft IIS Media Services, and other media servers.

For the most up-to-date information, tutorials, and tips, see the Wowza Documentation webpage.

To get up and running, see the Quick Start Guides.

# Adobe HDS (Adobe Flash Player)

Wowza Streaming Engine software can stream adaptive bitrate live and video on dema (VOD) content to Adobe Flash Player 10.1 or later using the Adobe HTTP Dynamic Streat (Adobe HDS) protocol. Adobe HDS is a chunk-based streaming protocol that uses HTTP delivery. All media-chunking and packaging necessary to deliver a stream using this pr is performed by the Wowza Streaming Engine server. Adobe HDS is referred to as "San streaming in the Wowza Streaming Engine configuration files.

When streaming VOD content, Wowza Streaming Engine software supports MP4 files (QuickTime container) and MP3 files. FLV files are supported for RTMP playback. The W Streaming Engine software supports the following video and audio codecs when using streaming protocol:

# Video

- H.264
- On2 VP6 (live only)
- Screen video and Screen video 2 (live only)
- Sorenson Spark (live only)

# Audio

- AAC, AAC Low Complexity (AAC LC), AAC High Efficiency (HE-AAC) v1 and v2
- MP3
- Speex (live only)

# Apple HLS (iPhone, iPad, iPod touch, QuickTime, and

# More)

Wowza Streaming Engine software can stream adaptive bitrate live and VOD H.264, AA and MP3 content to iOS-based devices (iPhone/iPad/iPod touch iOS version 3.0 or later) QuickTime player (version 10 or later), Safari browser (version 4.0 or later), and other such as the Roku and Amino set-top boxes and some brands of smart TVs using the Ap HTTP Live Streaming (Apple HLS) protocol. Apple HLS is a chunk-based streaming proto that uses HTTP for delivery. All media-chunking and packaging necessary to deliver a s using this protocol is performed by the Wowza Streaming Engine server. Apple HLS is referred to as "Cupertino" streaming in the Streaming Engine configuration files.

Wowza Streaming Engine software supports multiple encryption methods for protecting Apple HLS streams using DRM. See How to secure Apple HLS streaming using DRM encryption.

Wowza Streaming Engine software can send timed data events to the iOS player in the of ID3 tags. <u>See How to convert onTextData events in live, VOD, or nDVR streams to timevents (ID3 tags) in Apple HLS</u> streams.

Wowza Streaming Engine software populates the playlist file with metadata that descri each of the available streams in an adaptive bitrate presentation. This enables iOS-bas players to intelligently select the appropriate streams based on hardware device capat

The iPhone, iPad, and iPod touch (iOS devices) and Apple TV digital media extender su the following media formats:

# Video

• H.264

# Audio

- AAC, AAC Low Complexity (AAC LC), High Efficiency AAC (HE-AAC) v1
- Dolby Digital 5.1 Surround Sound (AC-3) and Dolby Digital Plus (Enhanced AC-3 or AC-3)
- MP3

# **Microsoft Smooth Streaming (Microsoft Silverlight and**

# More)

Wowza Streaming Engine software can stream adaptive bitrate live and VOD H.264, AA and MP3 content to Microsoft Silverlight, Windows Phone devices, and other devices us the Microsoft Smooth Streaming protocol. Microsoft Silverlight is a cross-browser, cross platform technology that exists on many personal computing devices. Smooth Streami chunk-based streaming protocol that uses HTTP for delivery. All media chunking and packaging necessary to deliver a stream using this protocol is performed by the Wowza Streaming Engine server so there's no need for an IIS web server.

The following media formats can be used when streaming to Smooth Streaming clients

# Video

• H.264

# Audio

- AAC, AAC Low Complexity (AAC LC), AAC High Efficiency (HE-AAC) v1 and v2
- MP3

# **MPEG-DASH Streaming (DASH Clients)**

Dynamic Adaptive Streaming over HTTP (DASH), also known as *MPEG-DASH*, is a new international standard for adaptive streaming that's being adopted by the streaming industry. Wowza Streaming Engine software includes MPEG-DASH technology for streaming live and VOD content over HTTP to select DASH clients.

MPEG-DASH is similar to proprietary adaptive streaming technologies such as Apple HL Adobe HDS, and Microsoft Smooth Streaming in that it's a chunk-based streaming technology that uses HTTP for delivery. All media-chunking and packaging necessary to deliver a stream using this technology is performed by the Wowza Streaming Engine so Note that in MPEG-DASH terminology, chunks are called *segments*.

MPEG-DASH servers give DASH clients a list of the available media chunk URLs in a Me Presentation Description (MPD) manifest. The MPD describes chunk information such a timing, language, timed text, and media characteristics (video resolution and bitrate). request media chunks sequentially based on network conditions, device capabilities, a other factors to enable uninterrupted playback of the adaptive bitrate media presentat

The MPEG-DASH stan<u>dard (ISO/IEC 23009-1</u>) defines segment container formats for ISO Media File Format (ISOBMFF) and MPEG-2 Transport Streams (MPEG-2 TS). MPEG-DASH codec-agnostic and supports multiplexed and non-multiplexed encoding. Multiple contexprotection (DRM) schemes are supported; however, a Common Encryption (CENC) star (<u>ISO/IEC 23001-7</u>) is being developed in conjunction with MPEG-DASH to allow content encrypted once and then streamed to DASH clients that support different licensing sys

The following media formats can be used when streaming to DASH clients:

# Video

- H.264
- VP8
- VP9

# Audio

- AAC, AAC Low Complexity (AAC LC), AAC High Efficiency (HE-AAC) v1 and v2
- Dolby Digital 5.1 Surround Sound (AC-3) and Dolby Digital Plus (Enhanced AC-3 or AC-3)
- Vorbis
- Opus

For more information about MPEG-DASH support in Wowza Streaming Engine software, <u>How to stream over MPEG</u>-DASH.

# Adobe RTMP (Adobe Flash Player)

Wowza Streaming Engine software communicates with Adobe Flash Player using the Re Time Messaging Protocol (RTMP). The Wowza Streaming Engine software can deliver adaptive bitrate live and VOD content to Flash Player using RTMP and it supports other features such as shared objects, video recording, video chat, remote procedure calls, a more. The Wowza Streaming Engine software supports all video and audio formats tha Flash Player supports:

# Video

- H.264
- On2 VP6
- Sorenson Spark
- Screen video and Screen video 2

# Audio

- AAC, AAC Low Complexity (AAC LC), AAC High Efficiency (HE-AAC) v1 and v2
- MP3
- Speex

Wowza Streaming Engine software supports the following RTMP protocol variants:

- RTMP. The base protocol and the most efficient and fastest of the variants.
- RTMPE. A lightweight encryption variant that helps to secure the data being transmitted between the Wowza Streaming Engine server and Flash Player.
- RTMPS. An encryption variant that transmits data over a secure SSL connection. RTMPS uses a more robust encryption layer than RTMPE to wrap the RTMP session Users with Subscription and Perpetual licenses for Wowza Streaming Engine software can <u>use Wowza StreamLock</u><sup>™</sup> AddOn to get free 256-bit SSL certificates use with RTMP (RTMPS) and HTTP (HTTPS).
- RTMPT. A tunneling variant that is used to tunnel through firewalls that employ stateful packet inspection.
- RTMPTE. An encryption variant of the RTMPT protocol.

Wowza Streaming Engine software includes bi-directional support for Action Message Format (AMF3 and AMF0) for data serialization (AMF3 was introduced in Flash Player 9 ActionScript 3.0).

# **RTSP/RTP (QuickTime, VLC, 3GPP Devices, Set-top**

# Boxes, and More)

Wowza Streaming Engine software can stream live H.264, AAC, and MP3 content to pla and devices that support the Real Time Streaming Protocol (RTSP), Real-time Transport Protocol (RTP), and MPEG-2 Transport Stream protocol (MPEG-2 TS). This includes playe and devices such as QuickTime player (version 10 or later), VideoLAN VLC player, set-t boxes, and 3GPP devices. The Wowza Streaming Engine software can also accept source streams from encoding devices that use these protocols, and supports RTP and MPEG-2 input and output over UDP as well as multicast. In addition, the Wowza Streaming Engi software supports interleaved RTSP/RTP (RTP over the RTSP TCP connection) and RTSP, tunneling (RTSP/RTP over HTTP), which enables RTSP/RTP to be delivered in network environments that don't allow UDP transmission.

| MPEG-TS             | ISO/IEC 13818-1                              |
|---------------------|--|
| MPEG-TS over RTP    | rfc2038                                      |
| RTP: AAC            | rfc3640, rfc3016, ISO/IEC 14496-3            |
| RTP: G.711          | rfc3551                                      |
| RTP: H.263          | rfc2429                                      |
| RTP: H.264          | rfc3984, QuickTime Generic RTP Payload Forma |
| RTP: MP3            | rfc2250                                      |
| RTP: MPEG-2 (video) | rfc2250                                      |
| RTP: MPEG-4 Part 2  | rfc3106                                      |
| RTP: Speex          | rfc5574                                      |
| RTSP                | rfc2326                                      |

Wowza Streaming Engine software supports the following RTSP, RTP, and MPEG specifications:

Wowza Streaming Engine software supports both Single Program (SPTS) and Multi Prog (MPTS) MPEG-TS streams and enables you to specify a specific program, a specific lang and a specific audio or video track in an MPTS stream.

Query parameters are part of the udp:// URL in a **.stream** file. There are four options for selecting a stream. For more information about how to use the query parameters, see to specify per-stream settings in .stream files.

# Video and Audio Streaming, Recording, and Chat

Wowza Streaming Engine software can stream live and VOD content to many player technologies. It supports the following VOD file formats: MP4 (QuickTime container - .m .f4v, .mov, .m4a, .m4v, .mp4a, .mp4v, .3gp, and .3g2), FLV (Flash Video - .flv), and MP content (.mp3). The Wowza Streaming Engine software can accept live video and audio streams from sources that support the RTMP, RTSP/RTP, native RTP, and MPEG-TS prot and it can record any live source stream to either the MP4 or FLV format.

Wowza Streaming Engine software can read and write Action Message Format (AMF0 a AMF3) data events to and from MP4 files. In addition, it supports MP4 multi-language caption and audio tracks.

Wowza Streaming Engine software can be used to re-stream SHOUTcast and Icecast (A AAC+, and MP3) audio streams and IP Camera (AAC, G.711 ( $\mu$ -law and A-law), H.264, a MP3) streams to supported player technologies. It maintains a single connection to the original source stream while delivering the stream to multiple players. It can also forwa embedded SHOUTcast and Icecast metadata, such as song title and artist, to Adobe Fla Player. The SHOUTcast example that's included with the Wowza Streaming Engine installation illustrates these capabilities.

Wowza Streaming Engine software can deliver two-way video, audio, and text chat to A Flash Player. This feature can be leveraged to deliver video conferencing applications of way messaging applications.

# Live Stream Transcoding and Transrating

The Transcoder feature in Wowza Streaming Engine software is a real-time video trans and transrating solution that provides the ability to ingest a live stream, decode the vid and audio, and then re-encode the stream for delivery to desired playback devices. It decode and re-encode audio and video in multiple formats with key frames that are proaligned for adaptive bitrate delivery. The following are some common scenarios:

- Transcode: Ingest a non-H.264/VP8/VP9 video and non-AAC/MP3/Vorbis/Opus audio stream and convert it to a set of H.263, H.264, VP8, or VP9 video and AAC, Vorbis, or Opus audio renditions that have aligned key frames for adaptive bitrat streaming.
- Transrate: Ingest an H.264 video and AAC/MP3 audio stream and create a full so bitrate renditions that have key frames aligned to the source stream for adaptive bitrate streaming.
- Audio-only: Ingest an H.264 video and Speex audio stream from Adobe Flash Pl and convert the Speex audio format to AAC, Vorbis, or Opus to make the stream compatible with additional player technologies.

Video and audio codecs

The Transcoder supports the following video and audio codecs:

| Video (decoding)        | Video (encoding) |
|-------------------------|------------------|
| H.264                   | H.263v2          |
| MPEG-2                  | H.264            |
| MPEG-4 Part 2           | VP8              |
| VP8                     | VP9              |
| VP9                     | * H.265          |
| Audio (decoding)        | Audio (encoding) |
| AAC                     | AAC              |
| G.711 (µ-law and A-law) | Vorbis           |
| MPEG-1 Layer 1/2        | Opus             |
| MPEG-1 Layer 3 (MP3)    |                  |
| Speex                   |                  |
| Vorbis                  |                  |
| Opus                    |                  |

# \* = Preview Transcoder Technology

Transcoder support for the H.265 codec is provided as an early feature preview of software that may be updated in a later release of Wowza Streaming Engine. Unexpected results can occur when using feature preview software. To get the best results when using this codec, see the following resources on our website:

- To use the H.265 video codec, follow the instructions in How to stream using HEVC/H.265 transcoding.
- You can't use Wowza Streaming Engine Manager to specify that the H.265 codec be used for your transcoded output renditions. Instead, you must edit your Transcoder template files in a text editor. For details, see the XML reference in "How to set up and run Wowza Transcoder for live streaming."

# Hardware acceleration

The Transcoder can be configured to take advantage of hardware acceleration on 64-b Windows and Linux operating systems, which is recommended but not required. If you configuration doesn't include hardware acceleration, a built-in software encoder is invo

The Transcoder can be configured to take advantage of the following hardware acceler technologies:

- Intel Quick Sync Video (for BOTH accelerated video decoding and encoding). F recommended workstation and server-level hardware specifications, and links to configuration instructions, see Server specifications for Intel Quick Sync accelera with Wowza Transcoder.
- NVIDIA NVENC (for accelerated video encoding ONLY) and NVIDIA CUDA/NVC (for accelerated video decoding ONLY). For a list of supported NVIDIA graphics ca that are compatible with the Transcoder, and links to configuration instructions, s <u>Server specifications for NVIDIA NVENC and NVIDIA CUDA accele</u>ration with Wow <u>Transcoder</u>.

# Note

This release of the Wowza Streaming Engine software has support for encoding H.265/HEVC video renditions using the NVIDIA **NVENC** hardware acceleration encoding option. This is a technology preview feature that may be updated in a later release of the software.

# Overlays

You can apply static GIF, JPEG, PNG, and BMP overlay images to streams and customize location, size, alignment, and opacity of the image to achieve stationary image effects as a watermark to your video. In addition, you can use a Java-based API to apply dynan overlay images to streams. The API can be configured manually or pre-programmed ba on external events, making it a powerful tool for adding premium TV-like experiences. How to add graphic overlays to live streams with Wowza Transcoder.

For more information about the Transcoder fea<u>ture, see the Wowza Transcoder User's</u> and th<u>e Wowza Transcoder</u> Forum.

Copyright © 2007–2018 Wowza Media Systems<sup>™</sup>, LLC. All rights reserved.

# Live Stream DVR Playback

The nDVR feature in Wowza Streaming Engine software provides the ability to record a stream into a cache on the media server. This enables viewers that join the live stream progress to access the cache to rewind to the beginning of the live stream (or rewind v the part of the stream that you specify) and then use DVR playback controls in their play watch the stream from that point forward. Configuration for client playback of recorded streams is similar to playback of live streams from the Wowza Streaming Engine serve

For more information about the nDVR feature, see the Wowza nDVR User's Guide and t Wowza nDVR Forum.

# Stream Encryption with DRM

The DRM feature in Wowza Streaming Engine software provides integration with third-p Digital Rights Management (DRM) Key Management Service partners to enable on-theencryption of premium live and VOD content for a variety of playback devices. For live workflows, per-stream encryption is available with the ability to rotate keys. For VOD workflows, per-asset and per-session encryption is available with the ability to rotate keys. Both live and VOD key rotation support is available for Apple HTTP Live Streaming (HLS

Integration is supported for the following Key Management Service providers:

- BuyDRM KeyOS. Provides Microsoft PlayReady encryption services for MPEG-DA Apple HLS, and Microsoft Smooth Streaming and playback with BuyDRM players Smooth Streaming clients on PCs, Macs, iOS devices, Android devices, Windows phones, game consoles, set-top boxes, and smart TVs.
- EZDRM. Provides Microsoft PlayReady encryption services for Smooth Streaming playback with Smooth Streaming clients on PCs, Macs, Windows phones, game consoles, set-top boxes, and smart TVs and with Discretix SecurePlayer media pl on Android and iOS devices.
- Verimatrix. Provides Verimatrix VCAS and Microsoft PlayReady encryption serving for HLS and Smooth Streaming playback with Verimatrix ViewRight and Smooth Streaming clients on PCs, Macs, iOS and Android devices, Windows phones, game consoles, set-top boxes, and smart TVs.

For more information about the DRM feature, see the Wowza DRM online tutorials and Wowza DRM Forum.

### Note

Wowza Streaming Engine software has APIs that enable encryption schemes for on-the-fly encryption of live and VOD Apple HLS streams, including **SAMPLE-AES** (sample-level encryption for version 5 of the Apple HLS streaming protocol), **ENVELOPE-PLAYREADY** (supported by BuyDRM player technology with PlayReady DRM) and **CHUNK-PLAYREADY** (supported by INSIDE Secure player technology with PlayReady DRM). The Wowza Streaming Engine software also has an API that enables on-the-fly encryption of live and VOD Microsoft Smooth Streaming format with PlayReady protection for INSIDE Secure player technology. The DRM feature in Wowza Streaming Engine software isn't required to use these APIs. For more information, see:

- How to secure Apple HLS streaming using DRM encryption
- How to protect streams for delivery to INSIDE Secure player technology

# AddOns

Wowza<sup>™</sup> provides the following AddOn packages that you can download and install to extend and enhance Wowza Streaming Engine server functionality.

| AddOn Package         | Description  |   |
|-----------------------|--|---|
| Load Balancing        | The Dynamic Load Balancing AddOn enables you<br>HTTP, RTMP, and RTSP streams across multiple W<br>servers dynamically. The edge servers communic<br>or more load-balancing Wowza servers and client<br>the load-balancing server to get the least-loaded     | owza edge<br>ate with one<br>s connect to<br>edge server. |
|                       | See How to get the Dynamic Load Balancing Add  | Dn.   |
| Central Configuration | The Central Configuration AddOn provides a system<br>managing multiple Wowza media servers in a con-<br>environment from a central location. You can mod<br>system to fit most CDN and service provider envi-<br>See How to get Central Configuration AddOn. | nplex<br>dify the   |

| Network Security     | The Wowza StreamLock <sup>™</sup> AddOn is a security option for<br>network encryption that provides near-instant provisioning of<br>free 256-bit Secure Sockets Layer (SSL) certificates to verified<br>Wowza users for use with Wowza Streaming Engine software.<br>StreamLock-provisioned SSL certificates provide the best<br>security when used with RTMP. The certificates can also be<br>used for secure HTTP streaming (HTTPS). The certificates |
|----------------------|--|
|                      | expire after one yea <u>r. See How to get SSL certificates from the</u><br><u>StreamLock se</u> rvice.   |
| GeolP Locking        | The GeoIP AddOn enables you to restrict access to streamed content based on a client's geographic location. See How to enable geographic locking.  |
| Stream Name Aliasing | The StreamNameAlias AddOn enables you to simplify complex<br>URL-based stream names with aliases, provide security to limit<br>the valid stream names used, or map one stream name to<br>another. See How to get the StreamNameAlias AddOn.  |
| Load Testing         | You can use the Wowza Load Test Tool to generate load on a single Wowza Streaming Engine instance to test configuration and performance of RTMP and Apple HLS streaming. The Load Test Tool requires a Subscription or Perpetual license for the Wowza Streaming Engine software. See How to get the <u>Wowza Load Test</u> Tool.  |
| Module Collection    | The Wowza Module Collection is a collection of ready-to-use<br>modules and utilities that provide specific functionality for<br>Wowza-based applications. The modules in the collection are<br>already compiled, so Java experience isn't required. However,<br>source code is also provided with all of the modules to allow<br>easy modification for specific use <u>cases</u> . See Module<br><u>Collection</u> .                                     |

# Note

For an up-to-date list of the AddOn packages and information about how to use them, see the AddOns webpage.

# Installed Examples

The Wowza Streaming Engine software includes the following examples that highlight the server functionality. The examples are located in **[install-dir]/examples**. The **[install dir]/examples/README.html** file describes the available examples and how to install the server functional term of the server functionality.

| Example            | Description   |  |
|--------------------|---|--|
| VideoOnDemandStrea | ming example shows how to configure and playbac<br>on demand (VOD) content. It includes sample play<br>iOS devices, Adobe Flash, Microsoft Silverlight, an<br>clients and source code for an OSMF-based Flash<br>Microsoft Silverlight 3 or later. It uses the <b>default</b>           | yers for Apple<br>d DASH<br>Player and     |
| LiveVideoStreaming | This example shows how to configure and playbac<br>It includes sample players for iOS devices, Adobe<br>Microsoft Silverlight, and DASH clients and source<br>OSMF-based Flash Player and Microsoft Silverlight<br>uses the <b>live</b> stream type.                                    | Flash,<br>code for an                      |
| LiveDVRStreaming   | This example shows how to configure the nDVR fe<br>Wowza Streaming Engine server to record and pla<br>video with DVR. It includes sample players for Ado<br>Microsoft Silverlight and source code for Microsoft<br>or later. It uses the <b>live</b> stream type.                       | yback a live<br>be Flash and               |
| SHOUTcast          | This Adobe Flash example shows how to re-strear MP3 or AAC+ audio data through a Wowza Strean server. It uses the <b>shoutcast</b> stream type.   |  |
| VideoChat          | This Adobe Flash example shows how to impleme<br>between two users. It uses the <b>live-lowlatency</b> s<br>RTMP and the <b>Camera</b> and <b>Microphone</b> objects<br>and audio content. The example can stream video<br>data between two client connections or loop the o<br>itself. | tream type fo<br>to get video<br>and audio |

| WebcamRecording   | This Adobe Flash example shows how to impleme<br>advanced client-to-server video-recording capabil<br>Wowza Streaming Engine server using Adobe Flas<br>uses the <b>record</b> stream type and the <b>Camera</b> an<br>objects to get video and audio content. # Notes

- All Adobe Flash examples are implemented using ActionScript 3.0.
- Stream types are used to control the different types of streaming (live, VOD, chat, remote recording, and so on.) <u>See Stream Types</u>.

# **Wowza Streaming Engine Editions**

Subscription and Perpetual (lifetime) licenses are available for use with Wowza Stream Engine software to accommodate nearly any use case or b<u>usines</u>s need. See Wowza <u>Streaming Engine Pricing</u>.

# Chapter

# 5

# **Server Installation**

# How do I install Wowza Streaming Engine?

Wowza Streaming Engine<sup>™</sup> is a small but powerful Java server. This chapter describ how to install and run the Wowza Streaming Engine software. Wowza Streaming Engine software automatically installs a server version of the Java Runtime Environment (JRE) that it requires, making it easy to get a Wowza Streaming Engine se and running.

# Note

If you can't or don't want to use the version of Java that installs with Wowza Streaming Engine software, you can use a different JRE. Wowza Streaming Engine software requires a JRE that supports deploying Java in a server environment. Java 7 and 8 are supported but Java 8 is recommended. For more information on how to install a different, supported version of Java and how to instruct a Wowza Streaming Engine server to use it, see How to manually install and troubleshoot Java on your Wowza media server.

# **Before Installation**

If you're upgrading your Wowza Media Server<sup>™</sup> software (version 3.6 or earlier) to Wow Streaming Engine, you must uninstall Wowza Media Server before installing Wowza Streaming Engine. For instruct<u>ions, see How to upgrade Wowza Media Server software</u> Wowza Streaming Engine.

If you're updating your earlier version of Wowza Streaming Engine software to Wowza Streaming Engine, you shouldn't run the installer. Instead, run the updater. For instruct see <u>How to update your Wowza Streaming Engine</u> installation.

# Installing Wowza Streaming Engine

Wowza Streaming Engine software is installed using an install wizard on Windows, OS 2 Linux platforms. The Wowza Streaming Engine installer creates a new, clean instance of Wowza Streaming Engine software on the computer where it's installed.

- Go to the Wowza Downloads webpage and click Download for the installer for y desired operating system.
- 2. When the download completes, do one of the following:
  - Windows Double-click the installer file, WowzaStreamingEngine-4.7.
     windows-installer.exe, and follow the wizard instructions.
  - OS X Double-click the disc image file, WowzaStreamingEngine-4.7.6installer.dmg, and then double-click the installer package icon, WowzaStreaming Engine-4.7.6-osx-installer, and follow the wizard instructions.
  - **Linux** In the folder where you downloaded the Linux package, run the commands below. Then, follow the wizard instructions.

sudo chmod +x WowzaStreamingEngine-4.7.6-linux-x64installer.run sudo ./WowzaStreamingEngine-4.7.6-linux-x64-installer.run

During the installation process, you'll be asked:

- To accept the terms of the license agreement.
- To enter a valid license key. If you acquired a new license key, you'll find it in the email that you received from Wowza Sales. If you have a previous version of the Wowza Streaming Engine software installed, you may be able to use the license value found in the [install-dir]/conf/Server.license file.
- To create a user name and password for an Administrator account. You'll use this account to sign in to the browser-based Wowza Streaming Engine Manager. The name and password values are case-sensitive.
- To confirm or change the install location. By default, Wowza Streaming Engine software installs in the following directories:
  - Windows /Program Files (x86)/Wowza Media Systems/Wowza Streaming Engine 4.7.6/

Copyright © 2007-2018 Wowza Media Systems<sup>™</sup>, LLC. All rights reserved.

- OS X -
  - /Applications/Wowza Streaming Engine 4.7.6/
  - /Library/LaunchDaemons/
  - /Library/WowzaStreamingEngine/ (an alias)
  - /Library/WowzaStreamingEngine-4.7.6/
- Linux /usr/local/WowzaStreamingEngine-4.7.6/ (as the root user)
- If you want to start the Wowza Streaming Engine server and Wowza Streaming Engine Manager automatically after the installation finishes. Accept the default option Start Wowza Streaming Engine automatically. This option configures server and manager software to start automatically as system services. If you do choose this option, you must start the server software and the manager manually before you can use the software. See Starting and Stopping the Software and Star and Stopping Wowza Streaming Engine Manager.

# Note

A silent installation option is available for all platforms, including Red Hat Package Manager and Debian Package Manager options for Linux. Please note that approval is required to activate this option. For more information, contact sales@wowza.com.

# Starting and Stopping the Software

Wowza Streaming Engine software and Wowza Streaming Engine Manager can run as system services or in standalone mode.

System services start automatically when you start the computer and remain on until y turn them off. By default, Wowza Streaming Engine server software and Wowza Stream Engine Manager install as system services, which means you're running an active insta Wowza Streaming Engine software from the moment of install and any time the host computer is on.

Standalone mode operates independently of the operating system; you start and stop is software on demand. As with any standalone software, if you forget or fail to quit the program, you're prompted to do so when you turn off the computer. Standalone mode required for running the Transcoder with accelerated hardware in Windows. It's also us in testing environments because you can see log output in the console immediately.

Copyright © 2007-2018 Wowza Media Systems<sup>™</sup>, LLC. All rights reserved.

You can, however, manually start and stop Wowza software at any time, in either operational mode. For example, Subscription license holders might want to turn off the software as a service to avoid being charged for inactive instances of Wowza Streamin Engine.

# Note

Wowza Streaming Engine software can't run as a service and in standalone mode at the same time.

**Start and stop Wowza Streaming Engine as a service (Windows)** To start the Wowza Streaming Engine service:

- 1. Press Win key + R, type services.msc in the Run dialog box, and then click OK
- In the Services window, right-click Wowza Streaming Engine 4.7.6 and then Start.

To stop the service:

- 1. Press Win key + R, type services.msc in the Run dialog box, and then click OK
- In the Services window, right-click Wowza Streaming Engine 4.7.6 and then Stop.

Wowza Streaming Engine software can be set to start automatically as a Windows serv when Windows starts. To prevent the service from starting automatically when Window starts:

- 1. Press WIN key + R, type services.msc in the Run dialog box, and then click OK
- In the Services window, right-click Wowza Streaming Engine 4.7.6, and then Properties.
- 3. In the Properties dialog box, on the General tab, set Startup type to Manual

Start and stop Wowza Streaming Engine in standalone mode (Windows)

To start the Wowza Streaming Engine software in standalone mode, make sure that the Wowza Streaming Engine service is stopped (see above), and then do the following:

- 1. Press WIN key + R, type **cmd** in the **Run** dialog box, and then press Enter.
- In the Command Prompt window, execute the following commands: cd %WMSAPP\_HOME%\bin

Copyright © 2007–2018 Wowza Media Systems<sup>™</sup>, LLC. All rights reserved.

startup.bat

To stop the software:

- 1. Press WIN key + R, type **cmd** in the **Run** dialog box, and then press **Enter**.
- 2. In the Command Prompt window, execute the following commands:

cd %WMSAPP\_HOME%\bin shutdown.bat

### Notes

- The Wowza Streaming Engine 4.7.6 service runs under the Local System account by default. This can limit how the Wowza Streaming Engine software interacts with the underlying operating system. For example, you may have issues streaming content from UNC paths. To address this issue, update the service to run as a named user. To do this, right click the service name in the Services window, click Properties, and then on the Log On tab specify an alternate user account that the service can use to log on under This account.
- The hardware acceleration used by the Transcoder feature is only available when running Wowza Streaming Engine as a Windows standalone application. It's not available when the Wowza Streaming Engine software is invoked as a service.

# Start and stop Wowza Streaming Engine as a service (OS X)

To start the service, double-click the Start Services application in

/Applications/WowzaStreamingEngine-4.7.6 or open a terminal window and enter following command:

sudo launchctl load -w /Library/LaunchDaemons/com.wowza.WowzaStreamingEngine.plist

To stop the service, double-click the **Stop Services** application in

# /Applications/WowzaStreamingEngine-4.7.6 or open a terminal window and enter

following command:

sudo launchctl unload -w /Library/LaunchDaemons/com.wowza.WowzaStreamingEngine.plist

### Note

The **Start Services** and **Stop Services** applications also start and stop the Wowza Streaming Engine Manager system service. <u>See Starting and Stopping Wowza Streaming Engine Manager</u>.

# Start and stop Wowza Streaming Engine in standalone mode (OS X)

To start the software, double-click the **Start Standalone Mode** application in /**Applications/WowzaStreamingEngine-4.7.6** or open a terminal window and enter following commands:

cd /Library/WowzaStreamingEngine-4.7.6/bin ./startup.sh

To stop the software, double-click the **Stop Standalone Mode** application in /**Applications/WowzaStreamingEngine-4.7.6** or open a terminal window and enter following commands:

cd /Library/WowzaStreamingEngine-4.7.6/bin ./shutdown.sh

### Note

The **Start Standalone Mode** and **Stop Standalone Mode** applications also start and stop Wowza Streaming Engine Manager in standalone mode. See <u>Starting and Stopping Wowza Streaming Engine</u> <u>Manager</u>.

# Start and stop Wowza Streaming Engine as a service (Linux)

### Note

The operations in this section must be performed as the **root** user with **sudo** access.

To start the service, open a terminal window and enter one of the following commands depending on your Linux distribution:

sudo service WowzaStreamingEngine start

-or-

/etc/init.d/WowzaStreamingEngine start

To stop the service, enter:

sudo service WowzaStreamingEngine stop

-or-

/etc/init.d/WowzaStreamingEngine stop

# Notes

- If these instructions don't apply to your Linux distribution, consult your Linux manual.
- The Linux services script subsystem doesn't use the full \$PATH definition to determine the location
  of Linux commands. It uses what's known as the **init** path. This can lead to an issue on Linux
  distributions where the default installation location for Java can't be found by applying the **init** path.
  See <u>How to manually install and troubleshoot Java on your Wowza media server</u>.

# Start and stop Wowza Streaming Engine in standalone mode (Linux)

To start the software, open a terminal window and enter the following commands:

cd /usr/local/WowzaStreamingEngine/bin ./startup.sh

# To stop the software, enter:

cd /usr/local/WowzaStreamingEngine/bin ./shutdown.sh

# **Uninstalling Wowza Streaming Engine**

- Windows Go to the Programs and Features Control Panel, click Wowza S Engine 4.7.6, and then click Uninstall.
- OS X Go to /Applications/Wowza Streaming Engine 4.7.6 and double-click Streaming Engine Uninstall.
- **Linux** Run the following commands:

cd usr/local/WowzaStreamingEngine sudo ./uninstall

# **Running Wowza Streaming Engine as a Named User**

On OS X and Linux platforms, the default installation of Wowza Streaming Engine softw runs the server as the **root** user. If you want to run the server as a different user, follow instructions in How to run Wowza Streaming Engine as a Named User to create a new want configure the server to run as that user.

# Note

For security reasons, the non-**root** user can't bind to port numbers less-than or equal to 1024 on most Linux and Unix distributions. If you plan to run the Wowza Streaming Engine server on a lowernumbered ports such as 80 (HTTP), 443 (HTTPS, RTMPS), or 554 (RTSP), the server must continue to run as the **root** user.

# **Running Multiple Wowza Streaming Engine Instances**

You can run multiple instances of the same version of Wowza Streaming Engine softwar one computer instead of running one large instance with multiple virtual hosts (VHosts *instance* is defined as a single copy of the running Streaming Engine software. This is u cases where additional resources are available on the computer but can't be used by a instance, your streaming workflow requires a custom design that won't work using a si instance, or you're testing a multiple-server deployment on a single computer. Each in requires a valid license. You can use a single Subscription license key for multiple insta and each instance is counted separately and reflected in your bill. See How to run multiple instances of Wowza Streaming Engine on one computer.

# **Entering a New License Key**

The license key you enter when you run Setup to install an instance of Wowza Streami Engine software is displayed in the **License Keys** box in Wowza Streaming Engine Ma you switch your licensing option for the Streaming Engine instance, you can replace th existing license key with the new license key without reinstalling the software. If you purchased license keys to enable the integrated Wowza Transcoder, Wowza nDVR, and Wowza DRM technologies for use with the licensed server instance, you can add these license keys. All license key values are stored in the **[install-dir]/conf/Server.license** the Wowza Streaming Engine installation.

Windows - %WMSCONFIG\_HOME%\conf\Server.license OS X - /Library/WowzaStreamingEngine/conf/Server.license Linux/Unix - /usr/local/WowzaStreamingEngine/conf/Server.license

To add license keys in Wowza Streaming Engine Manager, do the following:

- 1. Click the **Server** tab, and then click **Server Setup** in the contents panel.
- 2. On the Server Setup page, click Edit.
- 3. In the **License Keys** box, enter your license key for the Wowza Streaming Engin software. If you need to enter multiple license keys (for example, for the media

server software and for the Transcoder, nDVR, and DRM technologies), enter eac license key on a separate line.

 Click Save, and then click Restart Now at the top of the Server Setup page w prompted. The new license(s) take effect after the server is restarted.

### Notes

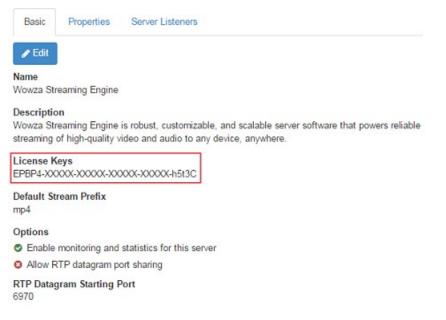

- After you restart the server, Wowza Streaming Engine Manager displays the first and last five digits of the license keys that you entered in the **License Keys** box to help protect this information.
- You can also open the Server.license file in a text editor, enter each new license key on a new line, and then restart the server.

# **Perpetual and Subscription Licenses for Wowza Streaming Engine**

Perpetual and Subscription licenses for Wowza Streaming Engine software provide for unlimited connections to the media server software instance and enable use of the Wo Transcoder, Wowza nDVR, and Wowza DRM technologies that are integrated with each licensed instance.

A Perpetual license is best for stable, long-term demand. A Perpetual license key purch after December 22, 2015 has an **EPBP4** prefix and is for use with one Streaming Engir instance and the integrated Transcoder, nDVR, and DRM technologies.

### Server Setup

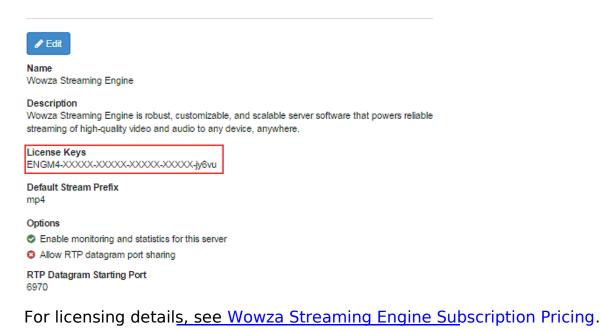

## For licensing details, see Wowza Streaming Engine Perpetual Pricing.

Copyright © 2007–2018 Wowza Media Systems<sup>™</sup>, LLC. All rights reserved.

A Subscription license is best for variable demand. You can install as many instances o Streaming Engine software as needed using the same license key and enable the Tran nDVR, and DRM technologies integrated with each instance. A Subscription license key an **ENGM4** prefix.

### Server Setup

## Notes

- If you purchased a Perpetual license for Wowza media server software before December 23, 2015, and the license key has an EPBU4 prefix, it licenses the Streaming Engine software and the Wowza Transcoder and Wowza nDVR technologies. A separate license key is provided to enable the Wowza DRM technology integrated with the server instance (you don't have to enter the DRM license key in the License Keys box unless you want to enable this technology in the media server software).
- If you purchased a license for Wowza media server software before January 1, 2015, contact sales@wowza.com to learn more about how to license the software.

# **Trial Licenses for Wowza Streaming Engine**

A <u>Trial license</u> for the Wowza Streaming Engine software lets you try out the software f free. After it expires and you acquire a new, paid license for the software, you must de the Trial license key from the **License Keys** box and then add the new, paid key. If yo sure if a license key is a Trial key, you can find it in the email that you received from W when you downloaded the trial software.

### Note

You don't need to reinstall the media server software or re-create its settings when you replace the Trial license key with a paid license for the software.

# **Ports Used for Streaming**

Before streaming with Wowza Streaming Engine software, you should open ports on yo firewall. The following table shows the default ports that the Wowza Streaming Engine server uses for streaming. All of these port numbers are configurable through the configuration files that are described later in this document.

| TCP 1935     | RTMP/RTMPE/RTMPT/RTSP-interleaved streaming | g/WOWZ™ |
|--------------|---|---------|
| TCP 8086-808 | 8Administration                             |         |
| UDP 6970-999 | RTP UDP streaming                           |         |

By default, a Wowza Streaming Engine server is configured to use only TCP port 1935 the streaming. You may want to configure additional ports for streaming such as TCP port HTTP or RTMPT streaming or TCP port 554 for RTSP streaming. To add an additional port to the **Virtual Host Setup** page in Wowza Streaming Engine Manager and edit the **De Streaming** host port.

| Host Ports        |           |            |      |                        |         |
|-------------------|-----------|------------|------|------------------------|---------|
| Add Host Port     | )         |            |      |                        |         |
| Name              | Туре      | IP Address | Port | SSL/StreamLock Enabled | Actions |
| Default Streaming | Streaming | *          | 1935 | false                  | ✓       |
| Default Admin     | Admin     | ÷          | 8086 | false                  |         |
|                   |           |            |      |                        |         |

In the **Edit host port** dialog box, add the additional ports to the **Port(s)** list (this list is delimited).

| Edit host port                                      |        | Х     |
|---|--------|-------|
| Name<br>Default Streaming                           |        |       |
| Type<br>Streaming                                   |        |       |
| IP Address *  |        |       |
| ÷   |        |       |
| Port(s) *   |        |       |
| 1935,80   |        |       |
| Comma-separated list                                |        |       |
| Enable SSL/StreamLock                               |        |       |
| Keystore Path (StreamLock certificate path)         |        |       |
|   |        |       |
| Keystore Password (StreamLock certificate password) |        |       |
|   |        |       |
|   |        |       |
|   |        |       |
|   | Cancel | Apply |

Wowza Streaming Engine software can't share ports with other programs or services, s make sure that there are no other programs or services running that share the added p

The following table shows some of the common ports used for streaming.

| TCP 80  | Adobe HDS, Apple HLS, Microsoft Smooth Streaming,<br>streaming, RTMPT | MPEG-DASH |
|---------|---|-----------|
| TCP 443 | RTMPS, HTTPS  |           |
| TCP 554 | RTSP  |           |

# Server Configuration and Tuning

Wowza Streaming Engine configuration settings are stored in a set of XML configuratio properties files in the **[install-dir]/conf** folder. The settings can be changed by config options and properties in Wowza Streaming Engine Manager or by editing them in a tereditor. If you choose to manage the Wowza Streaming Engine configuration settings by editing the XML files directly, be sure to review the Wowza Streaming Engine Configura-Reference, which describes the most commonly used configuration settings. The following configuration files are read when the server starts:

# Server Configuration Files

| MediaCache.xml   | - Media Cache configuration               |
|------------------|---|
| Server.xml       | - General server configuration            |
| Tune.xml         | - Server performance tuning configuration |
| VHosts.xml       | - Virtual hosts definition                |
| log4j.properties | <ul> <li>Logging configuration</li> </ul> |

# **VHost Configuration Files**

| StartupStreams.xml - Streams started at virtual host startup |                               |  |  |  |
|--|-------------------------------|--|--|--|
| VHost.xml  | - Virtual host configuration  |  |  |  |
| VHosts.xml   | - Virtual hosts configuration |  |  |  |

# **Application Configuration Files**

Application.xml - Application configuration

Wowza Streaming Engine software is automatically tuned to take best advantage of av hardware resources when the server starts. The server calculates an appropriate Java I size, garbage collection (GC) settings, and other Java command-line options based on available hardware, the computer and Java Virtual Machine (JVM) bitness, and other fac

By default, the server sets the Java heap size to a value that's suitable for application development environments. Before you deploy the server in production environments where it may use memory extensively when heavily loaded, you can select an option in Wowza Streaming Engine Manager that automatically sets the heap size to a predefine value that's appropriate for production use. You can also adjust many other performance settings from the default values that are calculated by the server in Wowza Streaming Manager to fine-tune the server's performance. See How to tune for performance.

# **Software Updates**

In between production releases, development builds are produced periodically in the for updates. This allows users to get early access to new features in the latest Wowza Stree Engine software releases and to give feedback. Information about what's included in ear update is included in a README.txt file that's included in the update archive (**.zip**) file. more information about how to apply an update to your server software, see How to up your Wowza Streaming Engine installation.

# Chapter

# **Application Configuration**

# *How do I create and configure an application for streaming?*

Wowza Streaming Engine<sup>™</sup> software is designed to handle multiple streaming proto All streaming is controlled through the creation and configuration of streaming applications. One application can be configured to simultaneously deliver either li or video on demand (VOD) content to multiple player technologies. It's easy to define a application in Wowza Streaming Engine Manager. For example, to create a new application named **myapplication**, do the following:

- 1. Click the **Applications** tab in Wowza Streaming Engine Manager and then click **Application** in the contents panel.
- 2. On the **Add Application** page, review the content in the Help panel to decide w type of application you want to create.
- 3. Click the application type in the **Add Application** page.
- In the New Application dialog box, enter the name myapplication and then cl Add.
- 5. The **myapplication** page is displayed so that you can configure the application settings.

A single application can be configured to deliver a live or video on demand (VOD) streat the same time to Adobe Flash Player, Apple iOS devices (iPhone, iPad, or iPod touch) of Apple TV digital media extender, Roku and Amino set-top boxes, Microsoft Silverlight, I clients, and RTSP/RTP-based players (including 3GPP smartphones and tablets, and And devices). The Tutorials section of the Wowza Streaming Engine documentation website step-by-step instructions for configuring applications for common streaming scenarios. remainder of this chapter covers application configuration details. For more detailed configuration information, see the Wowza Streaming Engine Configuration Reference.

# Applications and Application Instances

# (Application.xml)

An **Application.xml** file defines the configuration that you set up in Wowza Streaming Manager for a given application. An application instance is an instantiation of an applic and provides a namespace and context for streaming. An application instance is started dynamically and a single application can have multiple named application instances ru simultaneously. If no name is specified for an application instance, then the default nat (**\_definst\_**) is used. In many streaming scenarios, a single application instance is used application and the name is never referenced and defaults to **\_definst\_**. It's more com to use multiple application instances in video chat and video conferencing scenarios w you must create multiple rooms for streaming. In this case, application instances are u separate streaming into rooms. Each room is a separate application instance, which pr separation and a namespace for each room.

When an application instance is loaded, it looks in the following locations for an **Application.xml** file (where **[application]** is the application name):

[install-dir]/conf/[application]/Application.xml [install-dir]/conf/Application.xml

The first **Application.xml** file that's found is used.

# **URL Formats**

All streaming in the Wowza Streaming Engine server is initiated with a Uniform Resource Locator (URL). The application and application instance names are specified as part of streaming URL. The URL formats used for streaming, whether for Adobe Flash Player, A iOS devices, Microsoft Silverlight, DASH clients, or RTSP/RTP, follow a similar format:

[protocol]://[address]:[port]/[application]/[applnstance]/[streamName]/[pos t-fix]

-where-

| [protocol]    | streaming protocol (bttp. stmp. stop. and co.op)                           |
|---------------|--|
| [protocol]:   | <ul> <li>streaming protocol (http, rtmp, rtsp, and so on)</li> </ul>       |
| [address]:    | <ul> <li>address of the server running Wowza Streaming Engine</li> </ul>   |
| [port]:       | <ul> <li>port number to use for streaming (1935 is the default)</li> </ul> |
| [application] | - application name   |
| [appInstance] | - application instance name  |
| [streamName]  | - stream name and prefix   |
| [post-fix]    | <ul> <li>option information specific to player technology</li> </ul>       |

In most streaming scenastics, miname] doesn't have path elements and the default [appInstance] name is used, the URL can be shortened to:

[protocol]://[address]:[port]/[application]/[streamName]

The following are example URLs for different player technologies. The examples assum a live video with the stream name **myStream** using the application name **live** is strea

## Adobe HDS

http://mycompany.com:1935/live/myStream/manifest.f4m

# Apple HLS

http://mycompany.com:1935/live/myStream/playlist.m3u8

#### **Microsoft Smooth Streaming**

http://mycompany.com:1935/live/myStream/Manifest

#### **MPEG-DASH Streaming**

http://mycompany.com:1935/live/myStream/manifest.mpd

## Adobe RTMP

Server: rtmp://mycompany.com/live Stream: myStream

#### **RTSP/RTP**

rtsp://mycompany.com:1935/live/myStream

Now is probably a good time to take a quick look at the default settings for applications rest of this chapter describes the most commonly configured items.

# **Stream Types**

Wowza Streaming Engine software uses named stream types to control the different ty streaming (live, VOD, chat, remote recording, and so on.). Stream types are automatic configured when you create different application types and configure their options in V Streaming Engine Manager. You can also edit the **Streams/StreamType** property in **Application.xml** using a text editor to change the stream type for an application. The following table shows the stream types and their uses.

| Stream type             | Description  |
|-------------------------|--|
| default                 | VOD  |
| file                    | VOD  |
| live                    | Publish and play live content (best for one-to-many streaming of live events)  |
| live-lowlatency         | Publish and play live content over RTMP (best for one-to-<br>one or one-to-few video/audio chat applications)  |
| live-record             | Same as <b>live</b> —in addition content is recorded   |
| live-record-lowlatency  | Same as <b>live-lowlatency</b> —in addition content is recorded  |
| liverepeater-edge       | Publish and play live content across multiple Wowza<br>servers in an origin/edge configuration (used to configure<br>edge application)                       |
| liverepeater-edge-low   | atteories and play live content across multiple Wowza servers in an origin/edge configuration (used to configure edge application when latency is important) |
| liverepeater-edge-orig  | inublish and play live content across multiple Wowza servers in an origin/edge/edge configuration (used to configure a middle-edge application)              |
| record                  | Video recording  |
| rtp-live                | Re-stream RTSP/RTP, native RTP, or MPEG-TS streams   |
| rtp-live-lowlatency     | Re-stream RTSP/RTP, native RTP, or MPEG-TS streams when latency is important   |
| rtp-live-record         | Same as <b>rtp-live</b> —in addition content is recorded   |
| rtp-live-record-lowlate | <b>nsa</b> me as <b>rtp-live-lowlatency</b> —in addition content is recorded   |
| shoutcast               | Re-stream SHOUTcast/Icecast MP3 or AAC+ audio streams  |
| shoutcast-record        | Same as <b>shoutcast</b> —in addition content is recorded  |

Each stream type exposes properties that are used for tuning the stream type. For exa the stream type definitions for **live** and **live-lowlatency** differ only in the tuning that's accomplished through the stream properties. Defined properties for a stream type can

Copyright © 2007–2018 Wowza Media Systems<sup>™</sup>, LLC. All rights reserved.

overridden on a per-application basis by defining new property values on an application **Properties** tab in Wowza Streaming Engine Manager or by editing the **Streams/Prop** container in **Application.xml**.

# **HTTP Streamers and Live Stream Packetizers**

HTTP streamers define the streams in an application (live or VOD) that are available fo playback to different player technologies. In Wowza Streaming Engine Manager, you ca select one or more of the following **Playback Types** options for an application. When selecting multiple options, the corresponding HTTP streamers are added to the <**HTTPStreamers>** section in **Application.xml** as a comma-separated list.

| Playback Type         | Description  |
|-----------------------|--|
| Adobe HDS             | Enables the application to stream live and VOD content to<br>Flash Player using the Adobe HTTP Dynamic Streaming<br>(HDS) protocol. It adds the <b>sanjosestreaming</b> HTTP<br>streamer to the <b><httpstreamers></httpstreamers></b> section in<br><b>Application.xml</b> .  |
| Apple HLS             | Enables the application to stream live and VOD content to<br>iOS-based devices (iPhone/iPad/iPod touch iOS version 3.0<br>or later), QuickTime player (version 10 or later), Safari<br>browser (version 4.0 or later), and to other devices such as<br>Roku and Amino set-top boxes and some brands of smart<br>TVs, using the Apple HTTP Live Streaming (HLS) protocol. It<br>adds the <b>cupertinostreaming</b> HTTP streamer to the<br><b><httpstreamers></httpstreamers></b> section in <b>Application.xml</b> . |
| Microsoft Smooth Stre | aiminges the application to stream live and VOD content to<br>Microsoft Silverlight using the Microsoft Smooth<br>Streaming protocol. It adds the <b>smoothstreaming</b> HTTP<br>streamer to the <b><httpstreamers></httpstreamers></b> section in<br><b>Application.xml</b> .   |
| MPEG-DASH             | Enables the application to stream live and VOD content to<br>DASH clients using the Dynamic Adaptive Streaming over<br>HTTP (DASH) protocol. It adds the <b>mpegdashstreaming</b><br>HTTP streamer to the <b><httpstreamers></httpstreamers></b> section in<br><b>Application.xml</b> .  |

|                        | origin applications in Wowza Streaming Engine                    | Manager, it |
|                        | enables the application to stream live content                   | from        |
|                        | Wowza Streaming Engine (origin) to Wowza St                      | reaming     |
|                        | Engine (edge). It adds the <b>dvrchunkstreamir</b>               | ng HTTP     |
|                        | streamer to the <b><httpstreamers></httpstreamers></b> section i | n           |
|                        | Application.xml.   |             |
|                        |  |             |

Live streams coming into a Wowza Streaming Engine server must be packaged (*packe* before they can be delivered to clients using HTTP streaming protocols. The

<Streams>/<LiveStreamPacketizers> section in Application.xml specifies the st protocols that are used when packetizing live streams. There are two types of packetiz streaming packetizers and repeater packetizers.

Streaming packetizers are used when delivering a live stream from a single Wowza server to clients. They're also used when delivering a live stream from an origin Wowza server to edge Wowza server when using the live repeater mechanism in an origin/edge configure. When you select **Playback Types** options in Wowza Streaming Engine Manager to cree HTTP streamers for live applications, the corresponding live stream packetizer values (separated by commas) are added to the **<LiveStreamPacketizers**> section in **Application.xml**.

| Playback Type        | Description  |                |
|----------------------|--|----------------|
| Adobe HDS            | Enables Adobe HDS live streaming to Flash Pla                                  | yer. It adds   |
|                      | the sanjosestreamingpacketizer streaming                                       | packetizer to  |
|                      | the <b><livestreampacketizers></livestreampacketizers></b> section in <b>A</b> | plication.xm   |
| Apple HLS            | Enables Apple HLS live streaming to iOS-based                                  | devices. It    |
|                      | adds the cupertinostreamingpacketizer st                                       | eaming         |
|                      | packetizer to the <livestreampacketizers></livestreampacketizers>              | section in     |
|                      | Application.xml.   |                |
| Microsoft Smooth Str | ealminges Microsoft Smooth Streaming to Silverl                                | ght. It adds   |
|                      | the <b>smoothstreaming</b> streaming packetizer                                | to the         |
|                      | <livestreampacketizers> section in Applie</livestreampacketizers>              | ation.xml.     |
| MPEG-DASH            | Enables MPEG-DASH streaming to DASH client                                     | s. It adds     |
|                      | the mpegdashstreamingpacketizer stream   | ing packetizer |
|                      | to the <b><livestreampacketizers></livestreampacketizers></b> section in       |                |
|                      | Application.xml.   |                |

For more information about how to implement the live stream repeater (origin/edge) mechanism for delivering a live media event across multiple Wowza servers, see Live S Repeater (Origin/Edge Live Streaming).

Copyright © 2007–2018 Wowza Media Systems<sup>™</sup>, LLC. All rights reserved.

#### Note

The nDVR feature in Wowza Streaming Engine software provides the ability to record a live stream while simultaneously allowing users to play or pause the live stream, rewind to a previously recorded point, or resume viewing at the live point. This capability can be extended to an edge Wowza server in an origin/edge configuration. See the Wowza nDVR User's Guide.

# **Timed Text Providers**

Wowza Streaming Engine software includes support for timed text (closed captioning) to live and video on-demand streams. The Wowza Streaming Engine server enables you to convert caption data from a variety of instream and file-based sources to appropriate caption formats for live and on-demand video streaming using the Adobe HDS, Apple H and RTMP streaming protocols. This feature helps US broadcasters to comply with the Twenty-First Century Communications and Video Accessibility Act of 2010 and increasi requirements in the European Union by providing captioning for television programs th distributed over the Internet.

# **Closed Captioning for Live Streams**

For live streams, Wowza Streaming Engine software can ingest instream closed caption information from CEA-608 data or AMF **onTextData** events. These ingested captions of delivered as CEA-608-formatted SEI data in Apple HLS streams or as **onTextData** even Adobe HDS and Adobe RTMP streams. In addition, instream CEA-608 caption data can be passed through the Transcoder for delivery in Apple HLS streams. For live and live edg applications in Wowza Streaming Engine Manager, you can configure the following **Clo Caption Sources** options to enable the application to ingest the caption data.

| Live Closed Caption So |   |   |

|                        | the captionLiveIngest property to the                            |   |
|                        | <timedtext>/<properties> section in App</properties></timedtext> | lication.xml.                           |
|                        |  |   |

See How to configure closed captioning for live streaming.

# **Closed Captioning for Video on Demand Streams**

For video on-demand streams, Wowza Streaming Engine software can extract caption of from 3GPP Timed Text data embedded in MP4 files or use caption files in a variety of for including Timed Text Markup Language (.ttml), SubRip Text (.srt), Scenarist Closed Cap (.scc), and Web Video Text Tracks (.vtt). The ingested captions can be delivered as CEA formatted SEI data in Apple HLS streams or as Action Message Format (AMF) **onTextD** events in Adobe HDS and Adobe RTMP streams. For VOD and VOD edge applications in Wowza Streaming Engine Manager, you can select one or more of the following **Closed Caption Sources** options to ingest caption data. When selecting multiple options, the corresponding timed text providers are added to the **<TimedText>** section in **Application.xml** as a comma-separated list.

#### VOD Closed Caption Sourcecription

|  |  |  |

See How to configure closed captioning for video on demand streaming.

# Transcoder and nDVR Configurations

The **<Transcoder>** and **<DVR>** containers in an **Application.xml** file serve to config application to use the Transcoder and nDVR features in Wowza Streaming Engine softw See th<u>e Wowza Streaming Engine Configuration Reference</u> and the following tutorials:

- How to set up and run Wowza Transcoder for live streaming
- <u>How to set-up and run Wowza nDVR for live streaming</u>

# Modules

Modules are Java classes that are loaded dynamically when an application instance is le and provide an application's functionality. In Wowza Streaming Engine Manager, the **Modules** list defines an order-dependent list of modules to load for a given application Many AddOn packages provide additional functionality through the use of modules. Second server-side modules.

In the manager, click the **Modules** tab on an application page to see the list of module are loaded.

| Setup   | Properties       | Modules       |   |  |
|---|------------------|---------------|---|--|
| lote: Item:   | s on this page : | should be con | figured by advanced users only.                               |  |
| Modules Java classes that extend an application's functionality. The list below defines an order-dependent list of modules to be loaded for a given application. The modules are loaded dynamically when the application instance is loaded. The base (ModuleCore) module must be included by the application for it to operate properly. |                  |               |   |  |
|   |                  |               |   |  |
| Name  | D                | escription    | Fully Qualified Class Name                                    |  |
| Name  |                  | escription    | Fully Qualified Class Name<br>com.wowza.wms.module.ModuleCore |  |
| Name<br>base<br>logging   | В                | •             |   |  |
| base  | B                | ase           | com.wowza.wms.module.ModuleCore                               |  |

Each module must have a unique **Name**. The **Description** information is for providing detailed description of the module and isn't used in any operations. The **Class** item is a qualified path to the Java class that provides the module's functionality. In general, new modules are always added to the end of the **Modules** list. The Java class that makes u server-side module is most often bound to a **.jar** file in the Wowza Streaming Engine installation. The Wowza Streaming Engine software comes with many modules that car added to the **Modules** list to provide additional functionality. For a complete list of the modules, see Built-in server-side modules. You can also use the Wowza Integrated Development Environment (Wowza IDE) to develop your own custom modules to provide additional functionality. See How to extend Wowza Streaming Engine using Java.

#### Notes

- Access to the **Modules** tab is limited to administrators with advanced pe<u>rmission</u>s. See <u>Managing</u> <u>Sign-In Credenti</u>als.
- Wowza provides a collection of utility modules that are ready to use in Wowza applications. These
  modules don't require you to use the Wowza IDE. See Module Collection.

## **Properties**

Properties are a list of name/value pairs that provide a means for tuning and modifying default application configuration. Properties can also be used server-side as a means to data to custom modules from applications. In the **Application.xml** configuration file, a property definition has the following form:

```
<Property>
<Name>[name]</Name>
<Value>[value]</Value>
<Type>[type]</Type>
</Property>
```

Where **<Name>** is the property name, **<Value>** is the property value, and **<Type>** i property type. Valid property types are: **Boolean**, **Integer**, **Long**, and **String**.

In Wowza Streaming Engine Manager, you can click the **Properties** tab on an application page and enable default properties to either add them to the application configuration override existing property values. For details about the properties, see the Wowza Stre Engine Configuration Reference.

Many articles on the Wowza website prescribe custom properties for tuning the server for adding advanced functionality. When adding custom properties, it's important to ad them to the correct **<Properties>** container in **Application.xml**. The article instruction always specify the **Path** value to use in the **Add Custom Property** dialog box, which property to the correct **<Properties>** container.

| Add Custom Property       | Х            |
|---------------------------|--------------|
| Path<br>/Root/Application | •            |
| Name *                    |              |
| Туре                      |              |
| String                    | T            |
| Value *                   |              |
|                           | Cancel + Add |

Copyright © 2007–2018 Wowza Media Systems<sup>™</sup>, LLC. All rights reserved.

#### Note

Access to the **Properties** tab is limited to administrators with advanced permissions. See Managing Sign-In Credentials.

# **Media Types**

Media types aren't defined in application configuration files but are an important part of streaming. Wowza Streaming Engine software supports many media types. It can read following media or file types:

- MP4 (QuickTime container .mp4, .f4v, .mov, .m4a, .m4v, .mp4a, .mp4v, .3gp, . etc.)
- **FLV** (Flash Video .flv)
- **MP3** content (.mp3)
- **SMIL** (Synchronized Multimedia Integration Language .smil)
- **AMLST** (API-based MediaList)

Media types are specified by appending a prefix to the stream name. For example to p MP4 file **mycoolvideo.mov**, use the stream name **mp4:mycoolvideo.mov**, where **m** media type prefix. If no media type prefix is specified, the media type prefix defaults to The following table shows the supported media type prefixes.

| Media type prefix | Description   |
|-------------------|---|
| mp4:              | QuickTime container (default if no prefix specified)                            |
| flv:              | Flash Video   |
| mp3:              | MP3 file  |
| id3:              | MP3 file (returns only ID3 tag information)                                     |
| smil:             | Synchronized Multimedia Integration Language (for<br>adaptive bitrate delivery) |
| ngrp:             | Named Group (for adaptive bitrate delivery)                                     |
| amlst:            | API-based MediaList (for adaptive bitrate delivery)                             |

The media type prefix is also used to control the file container that stores recorded live video. When publishing video, if the **mp4:** media type prefix is specified or if no prefix specified, then the content is recorded to an **MP4** (QuickTime) container. Only H.264,

and MP3 content can be recorded to an **MP4** container. If the **flv:** media type prefix is specified, an **FLV** (Flash Video) container is used.

Synchronized Multimedia Integration Language (**.smil**) files provide a means to specify group of live streams or VOD files for adaptive bitrate switching. For stream switching occur correctly, key frames must be properly aligned across all of the available bitrates live stream. For VOD, multiple files must be pre-encoded to the desired bitrates and ha frames that are aligned across all of the encoded files. The **smil**: media type prefix is a playback the content that's specified in **.smil** files.

The Transcoder feature in Wowza Streaming Engine software uses a templating system group streams into logical groups (called *Stream Name Groups*) for live adaptive bitrat delivery. Stream Name Groups and SMIL files serve the same purpose and either meth be used for playback of live streams. Stream Name Groups are defined in the transcod template and are available for playback using the **ngrp:** media type prefix.

Wowza Streaming Engine software has an API that can be used to intercept requests for adaptive bitrate streams and provide the stream grouping through Java API calls. To us feature, you must use the **amIst:** stream name prefix to use a set of Java objects that describe the adaptive bitrate stream (an *API-based MediaList*). When the Wowza Strea Engine server reads a SMIL file, it creates a MediaList and passes it back to the stream provider. This API provides a means for intercepting the requests and creating the Med dynamically in a Wowza Streaming Engine <u>module. See How to use Ja</u>va API calls to res <u>SMIL file requests</u>.

# **Content Storage**

By default Wowza Streaming Engine software is configured to stream VOD content from (and record VOD content to) the **[install-dir]/content** folder. You can specify a different storage location for a VOD application in Wowza Streaming Engine Manager by changing **Content Directory** value for the application. For example, to configure an application an application-specific content folder, you can select the **Application-specific direct** option:

| Со                              | ontent Directory                                    |  |
|---------------------------------|---|--|
| <ul> <li>Use default</li> </ul> |   |  |
|                                 | \${com.wowza.wms.context.VHostConfigHome}/content   |  |
| ۲                               | Application-specific directory                      |  |
|                                 | {com.wowza.wms.context.VHostConfigHome}/content/vod |  |
| 0                               | Use the following directory:                        |  |
|                                 |   |  |

Using this setting, content is streamed from the **[install-dir]/content/[application]** f where **[application]** is the application's name (**vod**).

Files that are required for streaming live content, such as Session Description Protocol files or **.stream** files are also stored in the **[install-dir]/content** folder by default. You specify a different storage location for a live application in Wowza Streaming Engine Manager by changing the **Streaming File Directory** value for the application. For exa configure an application to use an application-specific folder, you can select the **Applic specific directory** option:

| St      | reaming File Directory *                             |
|---------|--|
| $\odot$ | Use default  |
|         | {com.wowza.wms.context.VHostConfigHome}/content      |
| ۲       | Application-specific directory                       |
|         | {com.wowza.wms.context.VHostConfigHome}/content/live |
| $\odot$ | Use the following directory:                         |
|         |  |
|         |  |

Using this setting, the files can be accessed from the **[install-dir]/content/[applicat**i folder, where **[application]** is the application's name (**live**).

You can further customize content storage for your applications by specifying the fully qualified path to the storage location in the **Use the following directory** box. You ca substitute variables in place of path elements. The following variables are supported:

| \${com.wowza.wms.AppHome}<br>\${com.wowza.wms.ConfigHome}                                      | <ul> <li>Application home directory</li> <li>Configuration home directory</li> </ul>        |
|--|---|
| <pre>\${com.wowza.wms.context.VHost}</pre>   | - Virtual host name   |
| \${com.wowza.wms.context.VHostConfigHome}  | <ul> <li>Virtual host configuration<br/>directory</li> </ul>                                |
| <pre>\${com.wowza.wms.context.Application} \${com.wowza.wms.context.ApplicationInstance}</pre> | <ul> <li>Application name         <ul> <li>Application instance name</li> </ul> </li> </ul> |

# Chapter

# **Advanced Configuration Topics**

# *How do I take advantage of Wowza Streaming Engine features?*

This chapter covers more advanced streaming topics. Some of the functionality discuis provided by AddOn packages. AddOn packages are downloadable packages that include server extensions for adding more advanced features to the Wowza Streami Engine<sup>™</sup> software.

# MediaCasters, Stream Files, and Startup Streams

Wowza Streaming Engine software includes a system for re-streaming live streams call *MediaCaster*. The MediaCaster system is used to re-stream IP camera streams (RTSP/R streams), SHOUTcast/Icecast streams, streaming output from native RTP or MPEG-TS encoders, and RTMP streams from another Wowza media server (liverepeater streams) MediaCaster system pulls a stream from a stream source and makes it available for streaming to all player technologies supported by the Wowza Streaming Engine softwa This system works on demand—when the first request is received from a player for a g stream, a connection is made to the source stream and the stream is then made availate player. When the last player stops watching the stream, the MediaCaster system w for a timeout period. If no other players request the stream, the stream is stopped and available for streaming until another request is made.

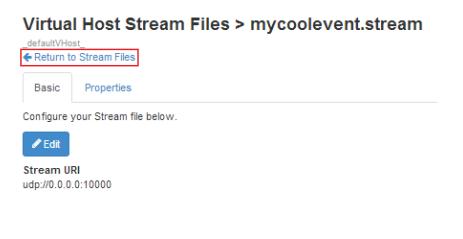

This on-demand startup methodology works great for RTMP and RTSP/RTP streaming w advanced packetization isn't required. However, the model doesn't work for the HTTP streaming protocols (Adobe HDS, Apple HLS, Microsoft Smooth Streaming, and MPEG-D streaming). An Apple iOS device requires about 30 seconds of video to be pre-packetiz before playback can start and Microsoft Silverlight clients require three times the key f duration. Therefore, the stream must be started before it's ready for streaming over H<sup>-</sup> Wowza Streaming Engine Manager provides features to start receiving MediaCaster str and to keep them running.

## **Stream Files**

An easy method for re-streaming live MediaCaster streams is to configure a Stream file with a **.stream** file name extension) that live applications can use to connect to the so stream through the MediaCaster system. A Stream file just contains the URI of the sour stream. When the source stream is started, a live application can use the information i Stream file to connect to the stream so that it's available for playback when requested players.

As an example, to create a Stream file named mycoolevent.stream, do the following

- 1. Click the **Server** tab in Wowza Streaming Engine Manager and then click **Stream** in the contents panel.
- 2. On the Virtual Host Stream Files page, click Add Stream File.
- In the Add Stream File dialog box, enter the name mycoolevent and then clic The mycoolevent.stream page is displayed.
- In Stream URI, enter the source stream URI and then click Save. For example, i you're using an MPEG-TS encoder, the URI value might be udp://0.0.0.0:10000
- 5. Click Return to Stream Files.

6. Click the **Connect** icon for **mycoolevent.stream**.

| Virtual Host Stream Files |                   |         |
|---------------------------|-------------------|---------|
| Stream Files              |                   |         |
| 华 Copy Stream File        | + Add Stream File |         |
| Name                      |                   | Actions |
| mycoolevent.stream        |                   | +) +    |

7. In the **Connect a Stream File** dialog box, configure the options to enable a live application to connect to the stream and then click **OK**.

| Connect a Stream File  | Х |
|--|---|
| Stream Name  |   |
| mycoolevent.stream   |   |
| Application Name   |   |
| live   | • |
| Application Instance   |   |
| Connect to default application instance: _definst_   |   |
| O Connect to application instance:   |   |
|  |   |
| Enter an existing application instance name. The application instance will be<br>created if it does not exist. |   |
| MediaCaster Type   |   |
| rtp  | • |
|  |   |
|  |   |
| Cancel   | к |

Be sure to select the **MediaCaster Type** in the list that corresponds to the source stream type:

- Select rtp for IP Camera streams (RTSP/RTP streams) and for streams from native RTP and MPEG-TS encoders.
- Select **shoutcast** for SHOUTcast/Icecast streams.

Copyright © 2007–2018 Wowza Media Systems<sup>™</sup>, LLC. All rights reserved.

 Select **liverepeater** if the stream is an RTMP stream pulled from another server that's running Wowza Media Server or Wowza Streaming Engine software.

You can then use mycoolevent.stream in the following example URLs to play the stre

#### Adobe HDS

http://[wowza-ip-address]/live/mycoolevent.stream/manifest.f4m

#### Apple HLS

http://[wowza-ip-address]/live/mycoolevent.stream/playlist.m3u8

#### **Microsoft Smooth Streaming**

http://[wowza-ip-address]/live/mycoolevent.stream/Manifest

#### **MPEG-DASH**

http://[wowza-ip-address]/live/mycoolevent.stream/manifest.mpd

#### Adobe RTMP

Server: rtmp://[wowza-ip-address]/live Stream: mycoolevent.stream

#### RTSP/RTP

rtsp://[wowza-ip-address]/live/mycoolevent.stream

#### Note

In the **SMIL Files** feature in Wowza Streaming Engine Manager, you can connect to live MediaCaster streams that are referenced in Synchronized Multimedia Integration Language (SMIL) files. In the **Incoming Streams** feature, you can connect to MediaCaster streams to record them.

#### **Startup Streams**

The second method for starting live MediaCaster streams is to use the **Startup Stream** feature in Wowza Streaming Engine Manager to create stream entries in the **[installdir]/conf/StartupStreams.xml** file. Stream entries in this file are automatically started the server is started (or more specifically, when a virtual host is started). The format of single entry in **StartupStreams.xml** is: <StartupStream>

<Application>[application]</Application> <MediaCasterType>[mediacaster-type]</MediaCasterType> <StreamName>[stream-name]</StreamName> </StartupStream>

-where-

[application]:

- name of live application that re-streams the source stream

[mediacaster-type]:

- valid mediacaster type: rtp, rtp-record, shoutcast, shoutcast-record, liverepeater

[stream-name]:

- name of the source stream

As an example, to create a stream entry in **StartupStreams.xml**, do the following:

- Click the Server tab in Wowza Streaming Engine Manager and then click Startu Streams in the contents panel.
- 2. On the Virtual Host Startup Streams page, click Add Startup Stream.

3. In the **Add to Startup Streams** dialog box, configure the options to create the the **StartupStreams.xml** file and then click **OK**.

| 40 | ld to Startup Streams   | 1 |
|----|---|---|
| St | ream Name   |   |
|    | mpegts.stream   |   |
| Aj | oplication Name   |   |
|    | live  | v |
| Aj | oplication Instance   |   |
| ۲  | Connect to default application instance: _definst_  |   |
| 0  | Connect to application instance:  |   |
|    | Enter an existing application instance name. The application instance will be created if it does not exist. |   |
| M  | ediaCaster Type   |   |
|    | rtp   | ۲ |
|    |   |   |
|    |   |   |
|    | Cancel  | ¢ |

#### See How to start streams at server startup.

#### Note

The following server-side methods can also be used to start and stop streams using the MediaCaster system:

IApplicationInstance.startMediaCasterStream(...); IApplicationInstance.stopMediaCasterStream(...);

For more information about these methods, see the Wowza Streaming Engine Server-Side API.

# Live Stream Repeater (Origin/Edge Live Streaming)

A live stream repeater uses multiple Wowza servers in an origin/edge configuration to deliver live media content across multiple servers. The encoded media content is deliv to the origin server in the same manner as if you were delivering the content to a singl Wowza server. A player requests the content from an edge server, which maintains a s connection per-unique stream to the origin. Origin/Edge configuration occurs at the application level. A single Wowza Streaming Engine instance can be configured as an of for one application and as an edge for another application. The example in this section uses a single origin server with an application named **live**. To configure the origin server, do the following:

- 1. In Wowza Streaming Engine Manager, click the **Applications** tab.
- 2. On the **Add Application** page, click **Live**.
- 3. In the New Application dialog box, enter the following application name: liveo
- 4. On the **liveorigin** application page, select the following **Playback Types**:
  - MPEG-DASH
  - Apple HLS
  - Adobe HDS
  - Microsoft Smooth Streaming
- 5. Click **Save**.

To configure an edge server, do the following (repeat on each edge server):

- 1. In Wowza Streaming Engine Manager, click the **Applications** tab.
- 2. On the **Add Application** page, click **Live Edge**.
- 3. In the New Application dialog box, enter the following application name: livee
- 4. On the **liveedge** application page, select the following **Playback Types**:
  - MPEG-DASH
  - Apple HLS
  - Adobe HDS
  - Microsoft Smooth Streaming
- 5. If low latency is important, select the **Low-latency stream** check box (this adds load to the server).
- 6. In Primary Origin URL, Enter the URL of the liveorigin application using the W protocol URL prefix (wowz://). For example, if the origin server uses the domain name origin.mycompany.com, the value would be:

wowz://origin.mycompany.com/liveorigin

7. Click Save.

In the following examples, assume that the origin server uses the domain name origin.mycompany.com and that there are 3 edge servers with the domain names edge1.mycompany.com, edge2.mycompany.com, and edge3.mycompany.com stream name is mycoolevent, the URLs for players streaming from edge1 would be:

#### Adobe HDS

http://edge1.mycompany.com:1935/liveedge/mycoolevent/manifest.f4m

#### Apple HLS

http://edge1.mycompany.com:1935/liveedge/mycoolevent/playlist.m3u8

#### **Microsoft Smooth Streaming**

http://edge1.mycompany.com:1935/liveedge/mycoolevent/Manifest

#### **MPEG-DASH**

http://edge1.mycompany.com:1935/liveedge/mycoolevent/manifest.mpd

You can configure more than one origin server to provide a hot backup if the primary or server goes offline. For example, if the failover origin server has the domain name **origin2.mycompany.com**, and it's configured identically as the primary origin server would specify the following **Secondary Origin URL** value in the **liveedge** application each edge server:

wowz://origin2.mycompany.com/liveorigin

Edge servers try to connect to the first origin server, and if this fails, they try to connect the second origin server.

This example assumes that you're using an encoder in which the stream name is a sim name and not a URL. If you're using an encoder such as an MPEG-TS encoder in which stream name isn't a simple stream name, you can use **.stream** files on the origin serv hide the complex stream names. For example, if your complex stream name on the ori server is **udp://0.0.0.0:10000**, use the **Stream Files** feature in Wowza Streaming En Manager to create a file named **mycoolevent.stream** and set the contents to **udp://0.0.0:10000**. You can then use **mycoolevent.stream** in place of **mycoolev** example URLs above to play the stream.

#### Notes

 The WOWZ<sup>™</sup> protocol is a TCP-based messaging protocol in Wowza Streaming Engine software and is used for server-to-server communication. It's enabled by default. If one of the Wowza servers in the origin/edge configuration is running a version of the software that doesn't support the WOWZ protocol, an RTMP connection is established between that server and other servers instead.

Copyright © 2007–2018 Wowza Media Systems<sup>™</sup>, LLC. All rights reserved.

- You can secure the connection between Wowza servers in and origin/edge configuration by using a SecureToken shared secret. <u>See How to configure a live stream repeater</u>.
- If you use a non-push-based encoder (native RTP or MPEG-TS) and streaming players using any
  of the HTTP streaming protocols, you must use the **Startup Streams** feature in Wowza Streaming
  Engine Manager to start the stream on the origin server and keep it running. Streams don't need to
  be kept running on edge servers.
- To provide load balancing between edge servers, you can use the dynamic load balancing system. See <u>Dynamic Load Balancing</u>.

# Live Stream Recording

There are multiple ways to record live streams to VOD files for later playback, but the **Incoming Streams** feature for live applications in Wowza Streaming Engine Manager you the most control over the recording process. You can split in-process live stream recording archives into multiple on demand MP4 (QuickTime container) or FLV (Flash V container) files automatically, with the split points based on video duration, clock time, size. The user interface shows all current live source streams and enables you to control when the recording starts and stops, the file name and locations, the container format, other details. You can also control the live stream recording process using HTTP URL quand programmatically using the **LiveStreamRecordManager** APIs. See How to record streams.

For the Live and Live HTTP Origin application types in Wowza Streaming Engine Manag you can select the **Record all incoming streams** option to record all streams publish application by a live source. This recording option uses the **live-record** stream type ar creates a recording with a file name that's the same as the source stream name in the application's streaming file directory. To stop recording all source streams to these application types, you must clear the **Record all incoming streams** option and resta application.

Finally, you can record IP camera streams (RTSP/RTP streams), SHOUTcast/Icecast stre and streaming output from native RTP or MPEG-TS encoders using the MediaCaster sys The **Stream Files** and **Startup Streams** features in Wowza Streaming Engine Manag MediaCaster system to pull a stream from a stream source and make it available for streaming to all player technologies supported by the Wowza Streaming Engine softwa You can configure these features to record the source streams instead by selecting an appropriate **\*-record** stream type for the MediaCaster type (such as **rtp-record** for IP streams) and the streams are recorded to the streaming file directory for the selected application. <u>See MediaCasters, Stream Files, and Startup Streams</u>.

#### Notes

- The \*-record stream types are the easiest to use but also give you the least amount of control. If you use this method, the entire duration of the published stream is recorded to a single file in the live application's streaming file directory. If the stream source starts and stops, the file is versioned with a version number and a new file is started. You can control the container format used (MP4 or FLV) by specifying a stream name prefix in the stream source. If you specify the **mp4:** prefix, the stream is recorded to an MP4 (QuickTime) container. An MP4 container can only record H.264, AAC, and MP3 media data. If you specify the **flv:** prefix, the stream is recorded to an FLV container. The FLV container is the only option if you're recording with Flash Player.
- If you use one of the \*-record stream types and also configure the Incoming Streams feature for a live application to record a live source stream, two or more copies of the recording are created in the live application's streaming file directory by default. The \*-record stream types record the stream to a single file and the recorded file name is the same as the stream name. The Incoming Streams feature creates one or more recordings with file names that include the stream name and other information, depending on selected segmentation and versioning options.
- The <u>WebcamRecording example</u> in the Wowza Streaming Engine installation is a specialized way to record a remote live stream when using Adobe Flash Player. It uses the **record** stream type and built-in Flash Player capabilities to control the recording process.

# **Virtual Hosting**

The Wowza Streaming Engine software can be configured to run multiple virtual host ( environments on a single server. This lets multiple users share a server in separate environments. Each VHost environment has its own set of configuration files, application folders, and log files and can be configured with its own system resource and streamin limitations. By default, a Wowza server is configured with a single VHost named \_defaultVHost\_.

# **Configuration Files**

The **VHosts.xml** configuration file in the Wowza Streaming Engine **[install-dir]/conf** used to define each of the VHost environments. The following items are required in **VHosts.xml** to define a VHost:

- VHosts/VHost/Name. The name of the VHost.
- VHosts/VHost/ConfigDir. The configuration directory for the VHost. See Typica Configuration to view a sample directory structure.
- **VHosts/VHost/ConnectionLimit.** The maximum number of simultaneous connections that the VHost supports. If this value is **0**, the VHost can support an unlimited number of simultaneous connections.

# **Typical Configuration**

A typical **VHosts.xml** file for a VHost environment contains two VHosts. The following example shows the default VHost (**\_defaultVHost\_**) and a new VHost (**\_newVHost\_**):

| <root></root>  |
|--|
| <vhosts></vhosts>  |
| <vhost></vhost>  |
| <name> defaultVHost </name>                                  |
| <configdir>\${com.wowza.wms.ConfigHome}</configdir>          |
| <connectionlimit>0</connectionlimit>                         |
|  |
|  |
| <vhost></vhost>  |
| <name> newVHost </name>                                      |
| <configdir>\${com.wowza.wms.ConfigHome}/newVHost</configdir> |
| <connectionlimit>0</connectionlimit>                         |
|  |
|  |
|  |
|  |

The directory structure for the VHosts in the above example would be:

| [install-dir]                                       |
|---|
| [defaultVHost]                                      |
| [applications]                                      |
| [conf]  |
| Application.xml                                     |
| clientaccesspolicy.xml                              |
| crossdomain.xml                                     |
| MediaCache.xml                                      |
| StartupStreams.xml                                  |
| Tune.xml  |
| VHost.xml   |
| admin.password                                      |
| publish.password                                    |
| [content]   |
| [keys]  |
| [logs]  |
| [transcoder]  |
| [newVHost]  |
| [applications]                                      |
| [conf]  |
| Application.xml                                     |
| clientaccesspolicy.xml                              |
| crossdomain.xml                                     |
| MediaCache.xml                                      |
| StartupStreams.xml                                  |
| Tune.xml  |
| VHost.xml   |
| admin.password                                      |
| publish.password (Optional, see <b>Notes</b> below) |
| [content]   |
| [keys]  |
| [logs]  |
| [transcoder]  |
|   |

#### Notes

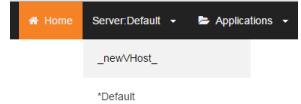

By default, all VHost environments share the **publish.password** file for the default VHost. You can
use the **Source Authentication** feature in Wowza Streaming Engine Manager to set up unique
publishing credentials for each VHost and the unique credentials are stored in this file.

Alternatively, you can retain the **publish.password** file when you copy the **[install-dir]/conf** folder to your new VHost environment and then configure the **securityPublishPasswordFile** property for new VHost applications to reference this file for publishing credentials. If you do this, you can't use the **Source Authentication** feature in the manager to update the file. See Custom password file location.

• For more information about how to configure per-VHost logging, see Logging.

VHosts are defined in the **[install-dir]/conf/VHosts.xml** file. Each VHost gets its own configuration directory structure with its own set of configuration files and **application** and **logs** folders. VHosts can be added, modified, and deleted through the **VHosts.xm** configuration file. If you change **VHosts.xml** while Wowza Streaming Engine software running, the changes take effect after restarting the server.

After adding a new VHost to **VHosts.xml** and creating its directory structure, select th VHost on the **Server** tab in Wowza Streaming Engine Manager to manage it.

It's important to note that Wowza Streaming Engine software only supports IP address/ based virtual hosting. It doesn't support domain name-based virtual hosting. In **VHost** each VHost must define **HostPort** entries with unique IP address and port combination don't conflict with other VHosts that are defined on the server. The following combinat represent valid VHost port configurations:

```
defaultVHost:
<HostPort>
  <lpAddress>192.168.1.2</lpAddress>
  <Port>1935</Port>
<HostPort>
newVHost:
<HostPort>
  <lpAddress>192.168.1.2</lpAddress>
  <Port>1936</Port>
<HostPort>
-or-
defaultVHost:
<HostPort>
  <lpAddress>192.168.1.2</lpAddress>
  <Port>1935</Port>
<HostPort>
newVHost:
<HostPort>
```

```
newVHost:
<HostPort>
<IpAddress>192.168.1.3</IpAddress>
<Port>1935</Port>
<HostPort>
```

Copyright © 2007–2018 Wowza Media Systems<sup>™</sup>, LLC. All rights reserved.

To set up the IP address and port values, click the **Server** tab in Wowza Streaming Eng Manager, select a VHost in the list, and then click **Virtual Host Setup** in the contents the **Virtual Host Setup** page, click **Edit** to update the IP addresses and port values for default host ports.

# Server-side Publishing (Stream and Publisher Classes)

Wowza Streaming Engine software includes the **Stream** class and the **Publisher** class doing server-side publishing. The **Stream** class is a high-level server-side API for mixin and VOD content on the fly into a single destination stream and lets you do television-s publishing. It also includes a package that enables creation of a server-side XML-based playlist. For more information about the **Stream** class, see How to schedule streaming Wowza Streaming Engine (StreamPublisher).

The **Publisher** class is a low-level publishing API that lets you inject raw compressed v and audio frames into the Wowza Streaming Engine server to create a custom live stre See the **Publisher** class server API Javadocs (**[install-dir]/documentation/serverap** current detailed documentation. The article How to use Publisher API and JSpeex to pul an audio stream (VOIP integration) includes an audio sample that walks through the pr of publishing Speex data to a stream.

# Chapter

# Server Management and Monitoring

# *How do I manage and monitor Wowza Streaming Engine?*

Wowza Streaming Engine<sup>™</sup> Manager enables you to conveniently set up, manage, monitor, and measure video and audio streams using a web browser on your computer, tablet, or phone. The new browser-based application extends the programmatic and command line configuration and management of the Wowza Stream Engine software, enabling publishers with a diverse range of technical abilities to have greater control and confidence when streaming video.

You can use Wowza Streaming Engine Manager with the latest versions of most moder browsers that support HTML5 and CSS 3. We recommend that you use the Google Chro browser. On Windows operating systems, if you have multiple browsers installed on yo computer, you can ensure that the web application always opens in the browser that y want to use by configuring the **Default Programs** feature.

# **Starting and Stopping Wowza Streaming Engine**

Manager

#### Notes

- Wowza Streaming Engine software must be started to use Wowza Streaming Engine Manager. See <u>Starting and Stopping the So</u>ftware.
- Wowza Streaming Engine Manager can't run as a service and in standalone mode at the same time.

- After starting Wowza Streaming Engine Manager, you can open it in a web browser with the following URL: http://[wowza-ip-address]:8088/enginemanager.
   Where [wowza-ip-address] is the Wowza Streaming Engine IP address or domain name.
- On Windows operating systems, you can open Wowza Streaming Engine Manager in the default browser from the Start menu (Start > All Programs > Wowza Streaming Engine 4.7.6 > Wow Streaming Engine Manager).
- For more information about how to sign in to Wowza Streaming Engine <u>Manager</u>, see <u>Managing</u> <u>Sign-In Credenti</u>als.

# Start and stop Wowza Streaming Engine Manager as a service (Windows)

To start the service:

- 1. Press WIN key + R, type services.msc in the Run dialog box, and then click OK
- 2. In the **Services** window, right-click **Wowza Streaming Engine Manager 4.7.6** then click **Start**.

To stop the service:

- 1. Press WIN key + R, type services.msc in the Run dialog box, and then click OK
- 2. In the Services window, right-click Wowza Streaming Engine Manager 4.7.6 then click Stop.

You can set Wowza Streaming Engine Manager to start automatically as a Windows ser when Windows starts. To stop the service from starting automatically when Windows s

- 1. Press WIN key + R, type services.msc in the Run dialog box, and then click OK
- In the Services window, right-click Wowza Streaming Engine Manager 4.7.6 then click Properties.
- 3. In the Properties dialog box, on the General tab, set Startup type to Manual

Start and stop Wowza Streaming Engine Manager in standalone mode (Windows)

To start Wowza Streaming Engine Manager in standalone mode, make sure that the Wo Streaming Engine Manager service is stopped (see above), and then do the following:

- 1. Press WIN key + R, type **cmd** in the **Run** dialog box, and then press Enter.
- 2. In the Command Prompt window, execute the following commands:

cd %WMSAPP\_HOME%\manager\bin startmgr.bat

Copyright © 2007–2018 Wowza Media Systems<sup>™</sup>, LLC. All rights reserved.

To stop the manager:

- 1. Press WIN key + R, type **cmd** in the **Run** dialog box, and then press Enter.
- 2. In the Command Prompt window, execute the following commands:

cd %WMSAPP\_HOME%\manager\bin shutdownmgr.bat

# Start and stop Wowza Streaming Engine Manager as a service (OS X)

To start the service, double-click the **Start Services** application in

/Applications/WowzaStreamingEngine-4.7.6 or open a terminal window and enter following command:

sudo launchctl load -w /Library/LaunchDaemons/com.wowza.WowzaStreamingEngineManager.plist

#### To stop the service, double-click the **Stop Services** application in

/Applications/WowzaStreamingEngine-4.7.6 or open a terminal window and enter following command:

sudo launchctl unload -w /Library/LaunchDaemons/com.wowza.WowzaStreamingEngineManager.plist

#### Note

The **Start Services** and **Stop Services** applications also start and stop the Wowza Streaming Engine system service. See <u>Starting and Stopping the</u> Software.

Start and stop Wowza Streaming Engine Manager in standalone mode (OS X)

To start the manager in standalone mode, double-click the **Start Standalone Mode** application in /**Applications/WowzaStreamingEngine-4.7.6** or open a terminal wind enter the following commands:

```
cd /Library/WowzaStreamingEngine-4.7.6/manager/bin ./startmgr.sh
```

To stop the manager, double-click the **Stop Standalone Mode** application in /**Applications/WowzaStreamingEngine-4.7.6** or open a terminal window and enter following commands:

cd /Library/WowzaStreamingEngine-4.7.6/manager/bin ./shutdownmgr.sh

Copyright © 2007-2018 Wowza Media Systems<sup>™</sup>, LLC. All rights reserved.

#### Note

The **Start Standalone Mode** and **Stop Standalone Mode** applications also start and stop Wowza Streaming Engine software in standalone mode. See <u>Starting and Stopping</u> the Software.

**Start and stop Wowza Streaming Engine Manager as a service** (Linux)

#### Note

The operations in this section must be performed as the **root** user with **sudo** access.

To start the service, enter one of the following commands, depending on your Linux distribution:

sudo service WowzaStreamingEngineManager start

-or-

/etc/init.d/WowzaStreamingEngineManager start

To stop the manager, enter:

sudo service WowzaStreamingEngineManager stop

-or-

/etc/init.d/WowzaStreamingEngineManager stop

#### Note

If these instructions don't apply to your Linux distribution, consult your Linux manual.

Start and stop Wowza Streaming Engine Manager in standalone mode (Linux)

To start the manager in standalone mode, open a terminal window and enter the follow commands:

cd /usr/local/WowzaStreamingEngine/manager/bin ./startmgr.sh

To stop the manager, enter:

cd /usr/local/WowzaStreamingEngine/manager/bin ./shutdownmgr.sh

# Managing Sign-In Credentials

The first time you start Wowza Streaming Engine Manager, you'll be asked to sign in w case-sensitive user name and password that you created when you installed the Wowz Streaming Engine software. This account has administrator access to enable control of Wowza Streaming Engine server through the manager. However, it doesn't provide acc advanced property, server listener, and module settings, which are reserved for expert Wowza users.

After you sign in, you can enable access to the advanced settings for the default administrator account and add accounts for other users. You can create additional user accounts with both administrative and read-only access.

## To enable access to advanced settings for the default administrator account

- 1. In Wowza Streaming Engine Manager, click the **Server** tab and then click **Users** contents panel.
- On the Users page, click the user name for the administrator account in the Use list.
- Click Edit, and then select the Allow access to advanced properties and fea check box.
- 4. (Optional) Enter a new password in the **Password** and **Confirm Password** field password values are case-sensitive.
- 5. Click **Save**. As the signed-in user, you'll be signed-out automatically and must signation.

You can also enable access to the advanced settings for the default administrator accound updating the **[install-dir]/conf/admin.password** file using a text editor. For example specify that the **Admin** user can access the advanced settings, specify the **advUser** g shown in the following example:

```
# Admin password file (format [username][space][password][space][group])
#username password group|group
Admin AdminPassword admin|advUser
```

Administrators can create accounts for other users with full administrative access to W Streaming Engine Manager or with read-only privileges.

#### To create new user accounts

- 1. In Wowza Streaming Engine Manager, click the **Server** tab and then click **Users** contents panel.
- 2. On the **Users** page, click **Add User**.
- 3. Enter a name for the user in **User Name** and a password for the user in **Password** and **Confirm Password** fields. The user name and password values are case-se
- 4. Specify the access level (**Read-Only** or **Administrator**) for the new user by select the appropriate **Access Level** option.
- 5. To enable the new user to either manage (**Administrator** user) or view (**Read-C** user) advanced settings, select the **Allow access to advanced properties and features** check box.
- 6. Click Add.

You can also add new user accounts by updating the **[install-dir]/conf/admin.passw** using a text editor. For example, to add the **newAdmin** and **readOnly** user accounts v access to advanced settings, edit the **admin.password** file as follows.

# Admin password file (format [username][space][password][space][group])
#username password group|group
Admin AdminPassword admin|advUser

newAdmin newAdminPassword admin|advUser readOnly readOnlyPassword advUser

The **readOnly** user can view the advanced settings but can't change them.

# Navigating in Wowza Streaming Engine Manager

This section introduces the different parts of the Wowza Streaming Engine Manager browser-based application to help you find your way around the user interface. For additional details, see How to find your way around Wowza Streaming Engine Manager

**1** The contents panel provides access to the following features that let you configure manage, and monitor the server and virtual hosts (VHosts).

**Server Setup:** Configure settings for the Wowza Streaming Engine instance such instance name, available license keys, and enabling/disabling the Monitoring feature for the server and its applications.

**Server Monitoring**: Monitor server resource consumption (CPU, memory, Java he and disk usage), source and playback connections, network throughput, and uptim See <u>How to monitor server connections</u>, <u>load</u>, <u>and application statistics</u>.

Virtual Host Setup: Manage virtual hosting environments on the server. By defa Wowza Streaming Engine software ships with a single VHost environment named \_defaultVHost\_; however, you can add more VHost environments and manage the separately with this feature. See Virtual Hosting.

**Virtual Host Monitoring**: Monitor VHost source and playback connections, network throughput, and uptime. See How to monitor server connections, load, and applicate statistics.

**Transcoder**: Monitor the number of concurrent live source streams ingested by the Transcoder and add, modify, and delete the Transcoder templates. See the Wowza Transcoder User's Guide.

Copyright © 2007–2018 Wowza Media Systems<sup>™</sup>, LLC. All rights reserved.

**Media Cache**: Configure the read-through caching mechanism that enables scalin video on demand (VOD) streams by re-streaming VOD file sources from HTTP-base servers that support HTTP/1.1 range requests and from network-attached file syste See How to scale video on demand streaming with Media Cache.

**Users**: Set up and manage administrator and read-only user accounts for Wowza Streaming Engine Manager. See Managing Sign-In Credentials.

**Source Authentication**: Create and manage case-sensitive user names and pase that RTMP-based and RTSP-based encoders and cameras can use to connect and publish a live stream if the live application requires authentication.

**Performance Tuning**: Adjust server performance settings from the default value are calculated when the server starts. See How to tune for performance.

**Logs:** View the messages in Wowza Streaming Engine and Wowza Streaming Eng Manager log files directly in the manager. Filtering and display options let you customize what's displayed and the UI provides a way for you to download large lo files to a compressed (zipped) folder for viewing outside of <u>the manager</u>. See How view log messages in Wowza Streaming Engine Manager.

**About**: View information about the Wowza Streaming Engine platform such as the installed Wowza Streaming Engine software version and license and the installed J Runtime Environment (JRE).

**Startup Streams**: Pull live IP Camera streams (RTSP/RTP streams), SHOUTcast/lc streams, and streams from native RTP or MPEG-TS encoders and start them automatically when the VHost starts. See Startup Streams.

**Stream Files**: Replace (alias) complex stream names that are published to Wowz Streaming Engine server from sources such as IP Camera streams (RTSP/RTP streat SHOUTcast/Icecast streams, and streams from native RTP or MPEG-TS encoders. S <u>Stream Fi</u>les.

**SMIL Files**: Create Synchronized Multimedia Integration Language (SMIL) files the organize streams of various bitrates into groups for HTTP adaptive bitrate streami See <u>How to stream adaptive bitrate content</u>.

When you click a server feature in the contents panel, a page is displayed that eny you to configure the feature settings. Advanced settings for fine-tuning the server configuration are available for some of the server features on **Properties** and **Set Listeners** tabs. These tabs are only available to users with advanced permissions Advanced Properties and Settings.

Copyright © 2007–2018 Wowza Media Systems<sup>™</sup>, LLC. All rights reserved.

- 3 Some features have buttons in the upper-right corner that provide additional functionality. Some server-level features let you restart the server and stop and re the VHost.
- 4 The Help panel provides details about how to configure the controls on the feature page. You can click the **Hide Help** button to hide this information. If the informati hidden, you can click the **Show Help** button to bring it back into view.

#### **Application Types**

An *application* is a set of configuration options in a Wowza Streaming Engine server the supports a specific use case for the delivery of streaming content. To add applications Wowza Streaming Engine Manager, click the **Applications** tab and then click **Add Application**.

| 👟 Applica | ations +   |
|-----------|------------|
| + Add A   | pplication |
| LIVE APP  | PLICATIONS |
| live      |            |
| VOD APP   | LICATIONS  |
| vod       |            |

# In the **Add Application** page that's displayed, you can add applications for six stream cases.

#### Add Application

Select an Application Type.

#### Live

#### VOD

Use this application to deliver live strldsæntshts application to stream video on players (single server) or as an origindsænsænd (VOD) files to players (single server). to deliver live streams to other servers running Wowza Media Server<sup>™</sup> or Wowza Streaming Engine software to scale content delivery to a large number of players.

#### Live Edge

#### VOD Edge

**VOD HTTP Origin** 

Use this application to ingest live streamesthis application to ingest video on from a live application on an origin semenand files from a Media Cache source. that's running Wowza Media Server or This application is then used to stream the Wowza Streaming Engine software. TWOSD files to players (single server). application is then used to deliver the live streams to players (single server).

#### Live HTTP Origin

Use this application to deliver live streamshts application to deliver video on an HTTP caching infrastructure using demand files to an HTTP caching streaming protocols (MPEG-DASH, Appleastructure using HTTP streaming HLS, Adobe HDS, and Microsoft Smooth Streaming). HDS, and Microsoft Smooth Streaming).

To add an application, click the **Application Type** in the page that corresponds to you case, enter a name for the application in the **New Application** dialog box, and then click Single instances of a live application type (named **live**) and an on demand application (named **vod**) are included in the default installation of Wowza Streaming Engine softward

| SELECTED APPLICATION<br>Select an application below<br>LIVE APPLICATIONS | Select an application below | Select an application below |

**1** The contents panel provides access to the following features that let you configure manage, and monitor the different application types.

**Application Setup:** Modify application settings Aslua paic this n types playback types (http streamers and packetizers), default content storage location, closed-captioning options, and other settings. Some settings vary by application type.

**Monitoring**: Monitor application source and playbapplication types connections, network throughput, and uptime. See How to monitor server connections, load, and application statistics.

**Sources (Live)**: Get connection information for Athlivedersplication types and cameras that publish a stream to this application. If you're viewing this page on your iOS or Android mobile device that has the Wowza GoCoder<sup>™</sup> encoding app installed, you can automatically configure the GoCoder app to publish a stream to this application. Wowza Streaming Engine software supports integrated configuration of additional live sources prov<u>ided by Works</u> With Wowza <u>partne</u>rs. You can connect many other live sources to live Wowza Streaming Engine applications, but you must configure the connection settings ma<u>nually</u>. See How to <u>connect a live source to Wowza Streaming Engine</u>.

**Stream Files**: Replace (alias) complex stream that are published to the application from sources sulcivea∉dPge Camera streams (RTSP/RTP streams), SHOUTcast/Icecast streams, and streams from native RTP or MPEG-TS encoders. See Stream Files.

**Incoming Streams**: View details about live stread his/ehappireation types published to this application and record them to video on demand (VOD) files for later playback. See How to record live streams.

**Wowza Player:** Send your live or on-demand Apipke HLS stream URL to Wowza Player Builder, and then USO Player Builder settings to customize your player and gerophice ge player embed code for your webpage or web application. See <u>Getting started with Wowza Player</u>.

**Stream Targets**: Send live streams to content **Alelliwerg** pplication types networks (CDNs), streaming servers, streaming services, and multicast networks for distributed delivery. See <u>Distribute Live Streams</u>.

**Source Security**: Configure options for securin AIRIT Mapappedication types RTSP-based source connections to this application (for example, from RTMP-based encoders).

**Playback Security**: Configure options for securAddapaddetiden types connections to a Wowza Streaming Engine server. For example, require a secure RTMP connection, specify a security token ("shared secret"), and restrict playback to specific IP addresses.

**SMIL Files**: Create Synchronized Multimedia Integration Language (SMIL) files that organize streams of VariouEdge bitrates into groups for HTTP adaptive bitrate streaming. See How to stream adaptive bitrate content. VOD Edge **nDVR**: Configure DVR playback of live streams **Asinig** the plication types nDVR feature. See the Wowza nDVR User's Guide.

**Transcoder**: Configure transcoding of live streading to suit desired playback devices using the Transcoder fleight the Transcoder fleight the Transcoder fleight the Transcoder User's Guide.

**DRM**: Integrate with DRM Key Management Serleive partners to enable on-the-fly DRM encryption of LivenEidge live and VOD content for a variety of playback d&OiDes. See <u>Stream Encryption with DRM</u>. VOD Edge

- When you click an application or one of its features in the contents panel, a page is displayed that enables you to configure the application or feature settings. Advance settings for fine-tuning the configuration are available for the application and som application features on **Properties** and **Modules** tabs. These tabs are only availad users with advanced permissions. See Advanced Properties and Settings.
- **3** Most application and feature pages have buttons in the upper-right corner that provide additional functionality. You <u>can access Test Players</u> to test your streams, application settings to create a new application with identical settings, restart an application, and delete an application.
- 4 The Help panel provides details about how to configure the controls on the application or feature page. You can click the **Hide Help** button to hide this information. If the information is hidden, you can click the **Show Help** button to bring it back into view.

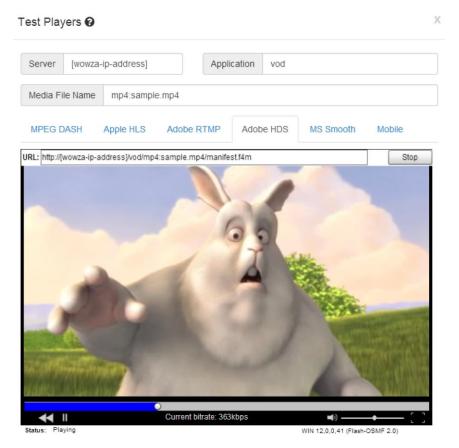

## **Test Players**

Wowza Streaming Engine Manager provides test players for all of the live and on dema application types so that you can test an application's streaming configuration. To acce test players, click the **Test Players** button in the upper-right corner of the application feature page. Then in the **Test Players** dialog box, click the tab for the streaming prot that you've configured for the application and want to test. The test players for live applications are preconfigured to play a live stream named **myStream** from the local Wowza Streaming Engine instance.

If you configured your encoder or camera to publish a stream to the live application wird different stream name, be sure to substitute it in place of **myStream** in the **Stream** b

The test players for on demand applications are preconfigured to play the **[install-dir]/content/sample.mp4** video file that's installed with the server software.

If you want to use your own VOD file, you can copy it to the **[install-dir]/content** root and substitute its file name in place of **sample.mp4** in the **Media File Name** box. If y custom VOD file isn't stored in the **[install-dir]/content** root folder, you must add the application instance name to the playback URL. For example, if the **sample.mp4** video in **[install-dir]/myVideos**, enter **vod/\_definst\_/myVideos** in the **Application** box.

#### Note

The test players can't display closed captions or playback encrypted streams. DVR playback is only supported by the Adobe HDS, Apple HLS, and Microsoft Smooth Streaming test players. If you change the default stream values to playback a new stream, you may need to restart the test players.

## **Advanced Properties and Settings**

Advanced settings for fine-tuning the server and application configuration are available Wowza Streaming Engine Manager. Some server features have advanced settings on **Properties** and **Server Listener** tabs to adjust the server configuration while applica some application features have **Properties** and **Modules** tabs to adjust the application configuration. The tabs that provide access to the advanced properties and settings are visible unless the signed-in user has advanced permissions. Administrators with advan permissions can configure the advanced properties and settings while Read-Only users only view (and not change) the advanced properties and settings. See Managing Sign-I <u>Credentials</u>.

**Properties** pages may have many properties that you can configure, so they're organ into categories. You can click a link in the **Quick Links** area at the top of the page to j the associated property settings. For example, you can click **Closed Captions**:

| live          |                  |                |                       |                 |                     |

Many articles on the Wowza website prescribe custom properties for tuning the server applications and to add advanced functionality. Each article describes how to add the opporties using the **Custom Properties** area on a **Property** tab:

Return to top 🛧

Custom Custom properties added by you to extend Wowza Streaming Engine functionality. Return to top 🛧

No custom properties defined.

If you can't find the property that you're looking for in the previous sections, click the Edit button and then click the Add Custom Property button on the Custom Property page.

See Properties.

# Chapter

# **Adobe Flash Streaming and Scripting**

# *What can I do with Wowza Streaming Engine and Adobe Flash Player?*

The Wowza Streaming Engine<sup>™</sup> software includes additional features that are only applicable to Adobe Flash Player when using the RTMP protocol (or any of its variant When used with Adobe Flash Player, the Wowza Streaming Engine software is more just a streaming server—it's an application server. It provides features such as shared objects, video chat, remote recording, and bi-directional remote procedure calls.

#### **Streaming Basics**

We'll start with the most basic code that's needed to play a live or video on demand st in Flash. Assume that we've followed the in<u>structions in How to set up video on deman</u> <u>streaming</u> and that we have an application named **vod** that's configured to stream ondemand video. In Adobe Flash Creative Suite 3 or later, do the following:

- 1. Create a new **Flash File** with ActionScript 3.0 support.
- 2. Open the library palette (On the **Window** menu, select **Library**).
- Right-click in the library palette, and then select New Video. Enter video in Syr name, and then click OK to create the video object.
- 4. Drag the **video** object from the library to the stage, and then in the properties palette, give it an instance name of **video1**.
- 5. In Window > Actions, select Scene 1.
- 6. Enter the following code:

```
var nc:NetConnection = new NetConnection();
var ns:NetStream = null;
function ncOnStatus(infoObject:NetStatusEvent)
{
    trace("ncOnStatus: "+infoObject.info.code);
    if (infoObject.info.code == "NetConnection.Connect.Success")
    {
        trace("Connection established");
        ns = new NetStream(nc);
        ns.bufferTime = 3;
        video1.attachNetStream(ns);
        ns.play("mp4:sample.mp4");
    }
    nc.addEventListener(NetStatusEvent.NET_STATUS, ncOnStatus);
    nc.connect("rtmp://localhost/vod");
```

#### 7. On the **Debug** menu, select **Debug Movie**.

You should now be streaming the **sample.mp4** video file. This is the most basic ActionScript 3.0 code that's needed for live and video on demand playback. If you inspected, you'll see how simple it is. We create a **NetConnection** object for streaming and event listener so that we can be notified when the connection to Wowza Streaming Engineeries established. When we're notified of a successful connection, we create a **Net** object and start to playback the stream.

The LiveVideoStreaming and VideoOnDemandStreaming example players that ar with the Wowza Streaming Engine software take this example a little further. The exam players support progress bars, pause, stop, and full screen. Inspecting the code for the example players is a good next step for learning how to stream. The VideoChat and WebcamRecording examples are a great starting point to learn how to publish video audio using the built-in Camera and Microphone <u>objects</u>. See the Installed Examples in this document.

### **Pre-built Media Players**

Building your own custom player with advanced functionality can be a daunting task. Another option is to use pre-built Flash video players. This section describes a few of the more popular Adobe Flash Player options.

#### Adobe FLVPlayback component

The Adobe FLVPlayback component is a pre-built video player component that you can to your own Flash project. It includes features such as play, pause, seek, stop, and full It comes with Adobe Flash CS3 or later. The component is updated occasionally, so it's to keep your Adobe Flash software up-to-date to ensure that you're running the most reversion. The nice thing about this component is that it can be integrated into your cust Flash code.

#### JW Player

<u>JW Player</u> is a pre-built Flash-based player. It includes a rich set of features such as pla skinning, closed-captioning, and ad-serving. It's fully supported and there's a commerc option. It also includes a built-in version of the Wowza SecureToken security mechanism

For more information about how to use JW Player with Wowza Streaming Engine softwa see the following support articles:

- How to use JW Player with Wowza Streaming Engine
- How to add SecureToken protection to JW Player

#### Flowplayer

<u>Flowplayer</u> is an open source pre-built Flash-based player. It includes a rich set of feature similar to JW Player. It also includes a built-in version of the Wowza SecureToken secure mechanism.

For more information about how to use Flowplayer with Wowza Streaming Engine softw see <u>How to use Flowplayer with Wowza Streaming Engine</u>.

#### Strobe Media Playback player

The Strobe Media Playback player supports RTMP streaming and Adobe HDS streaming player is built on the Open Source Media Framework (OSMF) and is hosted by Adobe. S <u>How to use Strobe Media Playback with a Wowza</u> media server.

# **Bi-directional Remote Procedure Calls**

Wowza Streaming Engine software supports bi-directional remote procedure calls to ar from Adobe Flash Player. Bi-directional remote procedures calls are a way for ActionSc code running in Flash Player to invoke server-side Java methods and pass data to a Wo Streaming Engine server. The server can, in turn, invoke client-side ActionScript metho pass data to Flash Player. This enables you to build rich client/server applications using Player and Wowza Streaming Engine software. These features are available when using RTMP protocol.

Calls from Flash Player to a Wowza Streaming Engine server are performed using the following method:

```
NetConnection.call(methodName, resultObj, params...)
```

For example, the following ActionScript 3.0 client-side code calls the server-side methor **doSomething**, passes the parameters **value1** and **value2**, and receives a single retu

```
function onMethodResult(returnVal:String):Void
{
     trace("onMethodResult: "+returnVal);
}
nc.call("doSomething", new Responder(onMethodResult), value1, value2);
```

#### Note

See <u>Custom module classes</u> for the server-side code for this method.

Receiving method calls from a Wowza Streaming Engine server is done by adding hand methods/functions to the client object that's attached to the **NetConnection** object. F example, the following ActionScript 3.0 client-side code adds the handler method **onSomethingHappened** that receives two string parameters **value1** and **value2**:

```
var clientObj:Object = new Object();
clientObj.onSomethingHappened(value1:String, value2:String):Void
{
     trace("onSomethingHappened: "+value1+":"+value2);
}
nc.client = clientObj;
```

For more information about the programming model, see How to extend Wowza Strear Engine using Java.

## **Remote Shared Objects**

Wowza Streaming Engine software supports Adobe Flash remote shared objects (RSOs which enable data-sharing between the Wowza Streaming Engine server and multiple Players. Remote shared objects are an extension of ActionScript objects that enable sh object data to be synchronized between Adobe Flash Players on the same or different of machines. Shared data is synchronized by the Wowza Streaming Engine server through event-based synchronization method. RSOs can also be persisted on the server to main data across sessions.

Each Flash Player that subscribes to a shared object is notified when the shared object updated. Shared object data can be changed client-side by Flash Player or server-side through the Wowza Streaming Engine **ISharedObject** API. The following example show ActionScript 3.0 code that's needed to create a remote shared object and set a value:

```
var nc:NetConnection = new NetConnection();
var test_so:SharedObject = null;
var timer:Timer = null;
function ncOnStatus(infoObject:NetStatusEvent)
{
   trace("ncOnStatus: "+infoObject.info.code);
   if (infoObject.info.code == "NetConnection.Connect.Success")
   {
       test so = SharedObject.getRemote("test", nc.uri);
       test so.addEventListener(SyncEvent.SYNC, syncEventHandler);
       test so.connect(nc);
       timer = new Timer(1000, 1);
       timer.addEventListener(TimerEvent.TIMER, setSOProperty);
       timer.start();
   }
function syncEventHandler(ev:SyncEvent)
Ł
   trace("syncEventHandler");
   var infoObj:Object = ev.changeList;
   for (var i = 0; i < infoObj.length; i++)</pre>
   {
       var info:Object = infoObj[i];
       if (info.name != undefined)
          trace(" "+info.name+"="+test so.data[info.name]);
       else
          trace(" [action]="+info.code);
   }
function setSOProperty(ev:TimerEvent):void
```

Copyright © 2007–2018 Wowza Media Systems<sup>™</sup>, LLC. All rights reserved.

```
{
    test_so.setProperty("testName", "testValue");
}
nc.addEventListener(NetStatusEvent.NET_STATUS, ncOnStatus);
nc.connect("rtmp://localhost/vod");
```

Wowza provides a downloadable Adobe Flash example (RemoteSharedObjects.zip) that illustrates the basics of remote shared objects. It implements the basic remote shared interface and the **onSync** event handler to highlight how data is synchronized between connections.

# Chapter

# **Server Administration**

# *How do I configure, manage, and deploy Wowza Streaming Engine?*

Wowza Streaming Engine<sup>™</sup> is a powerful Java server. It can be run standalone from command shell or installed as a system service. Running the server standalone is for developing custom Wowza Streaming Engine applications because the server be started and stopped quickly and server log messages can be viewed immediately in console window. Running the server as a system service is more often used for server deployments where the server must continue to run after you log off the computer or r be automatically started when the computer is rebooted.

#### **Configuring SSL and RTMPS**

Wowza Streaming Engine software supports Secure Sockets Layer (SSL) and RTMPS (R over SSL) and HTTPS (HTTP over SSL) streaming protection. SSL is a technology that al web browsers and web servers to communicate over a secure connection, with the encrypted data being sent and received in both directions. You can use Wowza Stream AddOn to get a free 256-bit SSL certificate, you can get an SSL certificate from a certific authority, or you can create a certificate yourself (a self-signed SSL certificate).

#### Notes

- If you want to get an SSL certificate from Wowza for use with Wowza Streaming Engine software, see <u>How to get SSL certificates from the StreamLock service</u>.
- If you want to get an SSL certificate from a certificate au<u>thority, see How to</u> request an SSL certificate from a certificate authority.
- If you want to create a self-signed SSL certificate, see How to create a self-signed SSL certificate.

# Logging

Wowza Streaming Engine software uses the Apache log4j logging utility as its logging implementation. The log4j logging system provides ample functionality for log formattic rolling, and log retrieval for most applications. By default, the Wowza Streaming Engine server is configured to log basic information to the server console and detailed informative the W3C Extended Common Log Format (ECLF) to a log file. Java messaging is also cap in the log files to help monitor and aid troubleshooting. The log files are written to the **[install-dir]/logs** folder.

For more information about log messages, scenarios that may cause these messages, suggestions for resolution, see How to troubleshoot error messages.

## **Logging Fields**

Wowza Streaming Engine software can generate the following logging fields.

| Field name      | Description   |               |
|-----------------|---|---------------|
| c-client-id     | Client ID number assigned by the server to the con  | nection       |
| c-ip            | Client connection IP address  | •             |
| c-proto         | Client connection protocol: http (Apple HLS), http (S<br>Streaming), rtmp, rtmpe, rtmps (HTTP-1.1), rtmpt (I<br>rtmpte (HTTP-1.1) |               |
| c-referrer      | URL of the Flash movie that initiated the connectior  | to the server |
| c-user-agent    | Version of the Flash client that initiated the connect server   | ion to the    |
| cs-bytes        | Total number of bytes transferred from client to ser (cumulative)   | ver           |
| cs-stream-bytes | Total number of bytes transferred from client to ser stream <b>x-stream-id</b> (cumulative)                                       | ver for       |
| cs-uri-query    | Query parameter for stream x-stream-id  |               |
| cs-uri-stem     | Full connection string for stream <b>x-stream-id</b> (excl<br>parameters)   | udes query    |
| date            | Date of log event   |               |
| s-ip            | IP address of the server that received this event   | ]             |

| s-port          | Port number through which the server received this event   |
|-----------------|--|
| s-uri           | Full connection string on which the server received this event                                     |
| sc-bytes        | Total number of bytes transferred from server to client (cumulative)                               |
| sc-stream-bytes | Total number of bytes transferred from server to client for stream <b>x-stream-id</b> (cumulative) |
| time            | Time of log event  |
| tz              | Time zone of log event   |
| х-арр           | Name of the application from which the event was generated   |
| x-appinst       | Name of the application instance from which the event was generated                                |
| x-category      | Log event category (server, vhost, application, session, stream)                                   |
| x-comment       | Extra comment about the log event  |
| x-ctx           | Extra data about the context of the log event  |
| x-duration      | Time, in seconds, that this event occurred within the lifetime of the <b>x-category</b> object     |
| x-event         | Log event ( <u>see Logging</u> Events)   |
| x-file-ext      | File extension of stream <b>x-stream-id</b>  |
| x-file-length   | File length, in seconds, of stream <b>x-stream-id</b>  |
| x-file-name     | Full file path of stream x-stream-id   |
| x-file-size     | File size, in bytes, of stream <b>x-stream-id</b>  |
| x-severity      | Log event severity (DEBUG, INFO, WARN, ERROR, FATAL)   |
| x-sname         | Name of stream x-stream-id   |
| x-sname-query   | Query parameters of stream x-stream-id   |
| x-spos          | Position, in milliseconds, within the media stream   |
| x-status        | Log event status <u>(see Logging Status Values</u> )   |
| x-stream-id     | Stream ID number assigned by the server to the stream object                                       |

| x-suri       | Full connection string for stream <b>x-stream-id</b> (includes query parameters) |
|--------------|--|
| x-suri-query | Query parameter for connection string  |
| x-suri-stem  | Full connection string for stream <b>x-stream-id</b> (excludes query parameters) |
| x-vhost      | Name of the virtual host from which the event was generated                      |

# Logging Events

Wowza Streaming Engine software can generate the following logging events.

| Event name        | Description   |              |
|-------------------|---|--------------|
| announce          | RTSP Session Description Protocol (SDP) ANNOUNCE                                |              |
| app-start         | Application instance start  |              |
| app-stop          | Application instance shutdown   |              |
| comment           | Comment   |              |
| connect           | Connection result   |              |
| connect-burst     | Connection accepted in burst zone   |              |
| connect-pending   | Connection pending approval by application and lice                             | ense manager |
| create            | Media or data stream created  |              |
| decoder-audio-sta | naudio decoding has started for a transcoded stream                             | I            |
| decoder-audio-sto | Audio decoding has stopped for a transcoded strear                              | n            |
| decoder-video-sta | <b>r</b> $\mathbf{\check{r}}$ ideo decoding has started for a transcoded stream |              |
| decoder-video-sto | <b>p</b> /ideo decoding has stopped for a transcoded strear                     | n            |
| destroy           | Media or data stream destroyed  |              |
| disconnect        | Client (session) disconnected from server                                       |              |
| encoder-audio-sta | naudio encoding has started for a transcoded stream                             |              |
| encoder-audio-sto | <b>p</b> Audio encoding has stopped for a transcoded strear                     | n            |
| encoder-video-sta | <b>r</b> $\mathbf{t}$ ideo encoding has started for a transcoded stream         |              |
| encoder-video-sto | $\mathbf{p}$ /ideo encoding has stopped for a transcoded strear                 | n            |

|                                | Dlayback has nauced   |          |
|--------------------------------|---|----------|
| pause                          | Playback has paused   |          |
| play                           | Playback has started  |          |
| publish                        | Start stream publishing   |          |
| record                         | Start stream recording  |          |
| recordstop                     | Stop stream recording   |          |
| seek                           | Seek has occurred   |          |
| setbuffertime                  | Client call to <b>NetStream.setBufferTime(secs)</b> logger milliseconds                                   | ed in    |
| setstreamtype                  | Client call to netConnection.call("setStreamType"   | ', null, |
|                                | "[streamtype]")   |          |
| server-start                   | "[streamtype]")<br>Server start   |          |
| server-start<br>server-stop    |   |          |
|                                | Server start  |          |
| server-stop                    | Server start Server shutdown  |          |
| server-stop<br>stop            | Server start Server shutdown Playback has stopped   |          |
| server-stop<br>stop<br>unpause | Server start         Server shutdown         Playback has stopped         Playback has resumed from pause |          |

# **Logging Status Values**

Wowza Streaming Engine software can generate the following logging status values.

| Status value | Description                                       |
|--------------|---|
| 100          | Pending or waiting (for approval)                 |
| 200          | Success   |
| 302          | Rejected by application with redirect information |
| 400          | Bad request                                       |
| 401          | Rejected by application                           |
| 413          | Rejected by license manager                       |
| 500          | Internal error                                    |

## Logging Configuration

Logging for a Wowza Streaming Engine server is configured in the **conf/log4j.propert** properties file. The log4j logging system has many logging configuration options. This s covers the basic options for enabling and disabling different logging fields, events, and categories.

The following example shows a basic **log4j.properties** file for a Wowza Streaming Enginetration instance:

log4j.rootCategory=INFO, stdout, serverAccess, serverError # Console appender log4j.appender.stdout=org.apache.log4j.ConsoleAppender log4j.appender.stdout.layout=com.wowza.wms.logging.ECLFPatternLayout log4j.appender.stdout.layout.Fields=x-severity,x-category,x-event,x-ctx,xcomment log4j.appender.stdout.layout.OutputHeader=false log4j.appender.stdout.layout.QuoteFields=false log4j.appender.stdout.layout.Delimeter=space # Access appender log4j.appender.serverAccess=org.apache.log4j.DailyRollingFileAppender log4j.appender.serverAccess.DatePattern='.'yyyy-MM-dd log4j.appender.serverAccess.File=\${com.wowza.wms.ConfigHome}/logs/wowzastre amingengine access.log log4j.appender.serverAccess.layout=com.wowza.wms.logging.ECLFPatternLayout log4j.appender.serverAccess.layout.Fields=x-severity,x-category,xevent;date,time,c-client-id,c-ip,c-port,cs-bytes,sc-bytes,x-duration,xsname,x-stream-id,sc-stream-bytes,cs-stream-bytes,x-file-size,x-filelength,x-ctx,x-comment log4j.appender.serverAccess.layout.OutputHeader=true log4j.appender.serverAccess.layout.QuoteFields=false log4j.appender.serverAccess.layout.Delimeter=tab # Error appender log4j.appender.serverError=org.apache.log4j.DailyRollingFileAppender log4j.appender.serverError.DatePattern='.'yyyy-MM-dd log4j.appender.serverError.File=\${com.wowza.wms.ConfigHome}/logs/wowzastrea mingengine error.log log4j.appender.serverError.layout=com.wowza.wms.logging.ECLFPatternLayout log4j.appender.serverError.layout.Fields=x-severity,x-category,xevent;date,time,c-client-id,c-ip,c-port,cs-bytes,sc-bytes,x-duration,xsname,x-stream-id,sc-stream-bytes,cs-stream-bytes,x-file-size,x-filelength,x-ctx,x-comment log4j.appender.serverError.layout.OutputHeader=true

log4j.appender.serverError.layout.QuoteFields=false

log4j.appender.serverError.layout.Delimeter=tab

log4j.appender.serverError.Threshold=WARN

#### Note

Always use forward slashes when referring to file paths (even on the Windows platform).

The first statement in the **log4j.properties** file sets the logging level to INFO and defi three appenders: stdout, serverAccess, and serverError. Setting the logging level to INFO configures the logging mechanism such that it only logs events with a severity of INFO higher. The logging severity in ascending order is: DEBUG, INFO, WARN, ERROR, and F, To log all events, set the logging level to DEBUG.

Appender properties allow you to control the way that log information is formatted and filtered. The following table shows some of the important properties.

| Property name  | Description  |                 |
|----------------|--|-----------------|
| CategoryExclud | € comma-separated list of logging categories. Only log e category isn't in this list are logged.                 | vents whose     |
| CategoryInclud | eComma-separated list of logging categories. Only log e specified categories are logged.                         | vents with the  |
| Delimiter      | The delimiter character to use between field values. Va<br>tab, space, or the actual delimiter character.        | alid values are |
| EventExclude   | Comma-separated list of logging categories. Only log e event name isn't in this list are logged.                 | vents whose     |
| EventInclude   | Comma-separated list of logging events. Only log even specified event name are logged.                           | ts with the     |
| Field          | Comma-delimited list of fields to log.   |                 |
| OutputHeader   | Boolean value (true/false) that instructs the logging sy<br>out a W3C ECLF header whenever the server is started |                 |
| QuoteFields    | Boolean value (true/false) that instructs the logging sy field data in double quotes.                            | stem to wrap    |

For more information about how to configure the log4j specific properties such as log fi rolling and additional log appender types, see the Log4j website. Wowza Streaming Engine software can also be configured to generate logs on a perapplication and per-virtual host basis. These configurations are included, but comment out, at the bottom of the **default [install-dir]/conf/log4j.properties** file. The first commented-out section includes configuration for per-application logging. The second commented-out section includes configuration for per-virtual host logging. To enable e of these features, remove the comments (**#** sign at the beginning of each of the lines) the section.

The per-application logging generates log files using the following directory structure:

[install-dir]/logs/[vhost]/[application]/wowzastreamingengine\_access.log [install-dir]/logs/[vhost]/[application]/wowzastreamingengine\_error.log [install-dir]/logs/[vhost]/[application]/wowzastreamingengine\_stats.log

The per-virtual host logging generates log files using the following directory structure:

[install-dir]/logs/[vhost]/wowzastreamingengine\_access.log [install-dir]/logs/[vhost]/wowzastreamingengine\_error.log [install-dir]/logs/[vhost]/wowzastreamingengine\_stats.log

This method for generating log files can be very useful if you want to offer Wowza Stre Engine software as a shared service to several customers.

# **Streaming Tutorials**

#### Where do I get step-by-step instructions?

he <u>Tutorials</u> section of the Wowza Streaming Engine documentation website has st by-step instructions for configuring common streaming scenarios. These instruction cover how to configure streaming to common player technologies such as Adobe Flash Player, Microsoft Silverlight, Apple iOS devices, and mobile devices. The following table briefly describes and provides links to our more popular online tutorials.

| Tutorial name                       | Description                                    |
|-------------------------------------|--|
| How to set up video on demand st    | reascribes how to configure an application to  |
|                                     | stream video on demand (VOD) content.          |
| How to set up live streaming using  | Describes how to publish a live stream from    |
| RTMP-based encoder                  | RTMP-based encoders to a Wowza Streaming       |
|                                     | Engine server and how to configure an          |
|                                     | application to deliver the live stream.        |
| How to set up live streaming using  | Describes how to publish a live stream from    |
| RTSP/RTP-based encoder              | RTSP/RTP-based encoders to a Wowza             |
|                                     | Streaming Engine server and how to configure   |
|                                     | an application to deliver the live stream.     |
| How to set up live streaming using  | Describes how to use a live encoder that       |
| <u>RTP encoder with SDP file</u>    | publishes a stream using Real-time Transport   |
|                                     | Protocol (native RTP) with Session Description |
|                                     | Protocol (SDP) files to stream live content.   |
| How to publish and play a live stre | aDescribes how to use a live encoder that      |
| (MPEG-TS based encoder)             | publishes a stream using the MPEG-             |
|                                     | 2 Transport Stream (MPEG-2 TS) protocol to     |
|                                     | stream live content.                           |

| How to connect a live source to W                      | <b>Des</b> cribes how to publish live streams from  |
|--|---|
| <u>Streaming Eng</u> ine                               | encoders and cameras to a Wowza Streaming<br>Engine server.   |
| How to set up and run Wowza Tran<br>for live streaming | Destribes how to configure the Transcoder<br>feature for a live application to transcode and<br>transrate live source streams to multiple<br>playback renditions that can be used in<br>adaptive bitrate (ABR) streams. |
| How to set up and run Wowza nDV<br>live streaming      | Describes how to configure the nDVR feature<br>for a live application to enable support for DVR<br>playback of live source streams.   |
| <u>How to configure a live stream</u> rep              | Describes how to configure live stream<br>repeater (origin/edge) applications. Live<br>stream repeater is a method for delivering a<br>single live stream across a multiple server<br>deployment to many viewers.       |
| How to re-stream video from an IP                      | Describes how to re-stream and play a live stream from an IP camera.  |
